

Vivekanand Education Society's Institute of Technology

An Autonomous Institute Affiliated to University of Mumbai
Hashu Advani Memorial Complex, Collector Colony, Chembur East, Mumbai - 400074.

Department of Information Technology

CERTIFICATE

This is to certify that **Khushi Jeswani** of **D15-A** semester **VI**, has successfully completed necessary experiments in the **MAD & PWA Lab** under my supervision in VES Institute of Technology during the academic year **2023-2024**.

Lab Assistant

Subject Teacher

Mrs. Kajal Jewani

Principal

Head of Department

Dr. Mrs. Shalu Chopra

Name of the Course : MAD & PWA Lab**Course Code :** ITL604**Year/Sem/Class :** D15A**A.Y.:** 23-24**Faculty Incharge :** Mrs. Kajal Jewani.**Lab Teachers :** Mrs. Kajal Jewani.**Email :** kajal.jewani@ves.ac.in**Programme Outcomes:** The graduate will be able to:

- PO1) Basic Engineering knowledge: An ability to apply the fundamental knowledge in mathematics, science and engineering to solve problems in Computer engineering.
- PO2) Problem Analysis: Identify, formulate, research literature and analyze computer engineering problems reaching substantiated conclusions using first principles of mathematics, natural sciences and computer engineering and sciences.
- PO3) Design/ Development of Solutions: Design solutions for complex computer engineering problems and design system components or processes that meet specified needs with appropriate consideration for public health and safety, cultural, societal and environmental considerations.
- PO4) Conduct investigations of complex engineering problems using research-based knowledge and research methods including design of experiments, analysis and interpretation of data and synthesis of information to provide valid conclusions.
- PO5) Modern Tool Usage: Create, select and apply appropriate techniques, resources and modern computer engineering and IT tools including prediction and modeling to complex engineering activities with an understanding of the limitations.
- PO6) The Engineer and Society: Apply reasoning informed by contextual knowledge to assess societal, health, safety, legal and cultural issues and the consequent responsibilities relevant to computer engineering practice.
- PO7) Environment and Sustainability: Understand the impact of professional computer engineering solutions in societal and environmental contexts and demonstrate knowledge of and need for sustainable development.
- PO8) Ethics: Apply ethical principles and commit to professional ethics and responsibilities and norms of computer engineering practice.
- PO9) Individual and Team Work: Function effectively as an individual, and as a member or leader in diverse teams and in multidisciplinary settings.
- PO10) Communication: Communicate effectively on complex engineering activities with the engineering community and with society at large, such as being able to comprehend and write

effective reports and design documentation, make effective presentations and give and receive clear instructions.

PO11) Project Management and Finance: Demonstrate knowledge and understanding of computer engineering and management principles and apply these to one's own work, as a member and leader in a team, to manage projects and in multidisciplinary environments.

PO12) Life-long Learning: Recognize the need for and have the preparation and ability to engage in independent and lifelong learning in the broadest context of technological change.

Program specific Outcomes

PSO1) An ability to manage and analyze data / information effectively for making better decisions.

PSO2) Demonstrate the ability to use state of the art technologies and tools including Free and Open Source Software (FOSS) tools in developing software.

Lab Objectives:

Sr. No.	Lab Objectives
The Lab experiments aims:	
1	Learn the basics of the Flutter framework.
2	Develop the App UI by incorporating widgets, layouts, gestures and animation
3	Create a production ready Flutter App by including files and firebase backend service.
4	Learn the Essential technologies, and Concepts of PWAs to get started as quickly and efficiently as possible
5	Develop responsive web applications by combining AJAX development techniques with the jQuery JavaScript library.
6	Understand how service workers operate and also learn to Test and Deploy PWA.

Lab Outcomes

Sr. No.	Lab Outcomes	Cognitive levels of attainment as per Bloom's Taxonomy
On Completion of the course the learner/student should be able to:		
1	Understand cross platform mobile application development using Flutter framework	L1, L2
2	Design and Develop interactive Flutter App by using widgets, layouts, gestures and animation	L3
3	Analyze and Build production ready Flutter App by incorporating backend services and deploying on Android / iOS	L3, L4
4	Understand various PWA frameworks and their requirements	L1, L2
5	Design and Develop a responsive User Interface by applying PWA Design techniques	L3
6	Develop and Analyze PWA Features and deploy it over app hosting solutions	L3, L4

Index

Sr.N o	Experiment Title	LO	DOP	DOS	Grade
1.	To install and configure the Flutter Environment	LO1	17/1/24	24/1/24	10
2.	To design Flutter UI by including common widgets.	LO2	24/1/24	31/1/24	10
3.	To include icons, images, fonts in Flutter app	LO2	31/1/24	7/2/24	10
4.	To create an interactive Form using form widget	LO2	7/2/24	14/2/24	10
5.	To apply navigation, routing and gestures in Flutter App	LO2	14/2/24	21/2/24	10
6.	To Connect Flutter UI with fireBase database	LO3	21/2/24	6/3/24	10
7.	To write meta data of your Ecommerce PWA in a Web app manifest file to enable “add to homescreen feature”.	LO4	6/3/24	13/3/24	15
8.	To code and register a service worker, and complete the install and activation process for a new service worker for the E-commerce PWA	LO5	13/3/24	20/3/24	15
9.	To implement Service worker events like fetch, sync and push for E-commerce PWA	LO5	20/3/24	27/3/24	15
10.	To study and implement deployment of Ecommerce PWA to GitHub Pages.	LO5	27/3/24	27/3/24	15
11.	To use google Lighthouse PWA Analysis Tool to test the PWA functioning.	LO6	27/3/24	27/3/24	15
12.	Assignment-1	LO1,LO2 ,LO3	6/2/24	5/2/24	5

Lab Outcome	LO1: Understand cross platform mobile application development using Flutter framework
Grade:	10

Name: Khushi Jeswani
Division: D15A
Roll No:30
Batch: B

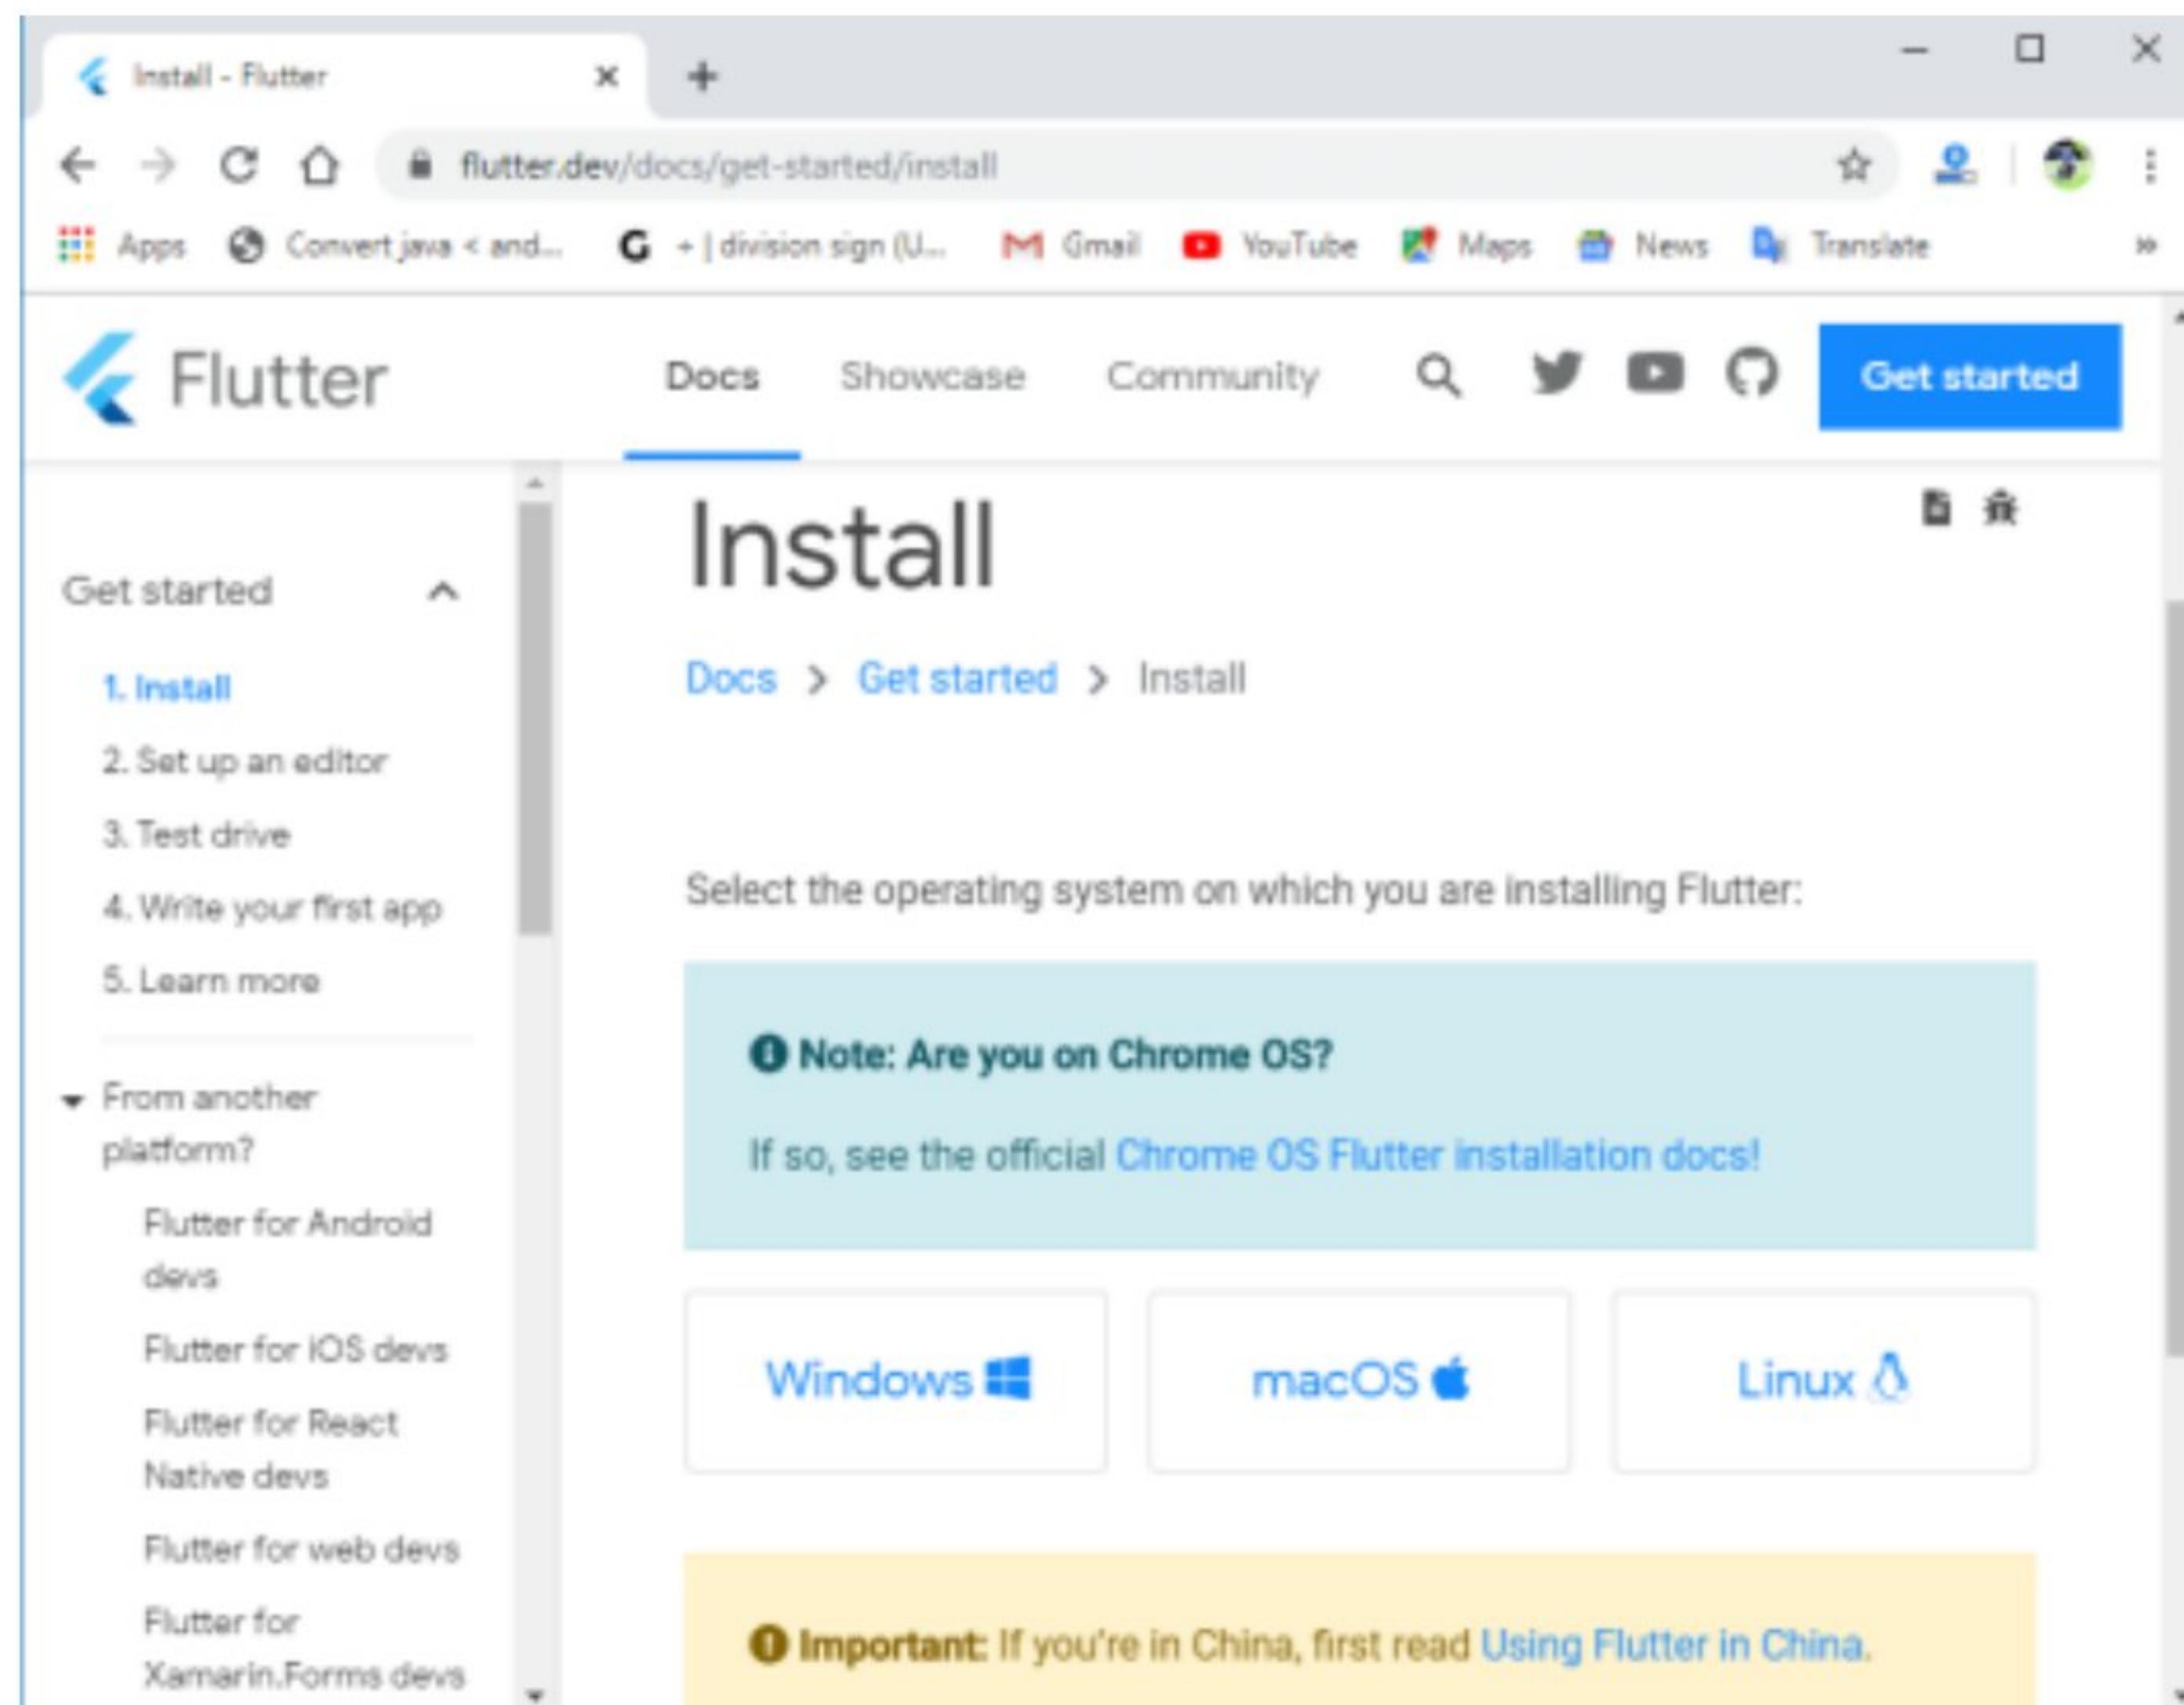

Experiment No. 1

Aim: To Install and Configure Flutter Environment

Pre Requisites:

Install the Flutter SDK

Step 1: Download the installation bundle of the Flutter Software Development Kit for windows. To download Flutter SDK, Go to its official [website `https://docs.flutter.dev/get-started/install`](https://docs.flutter.dev/get-started/install), you will get the following screen.

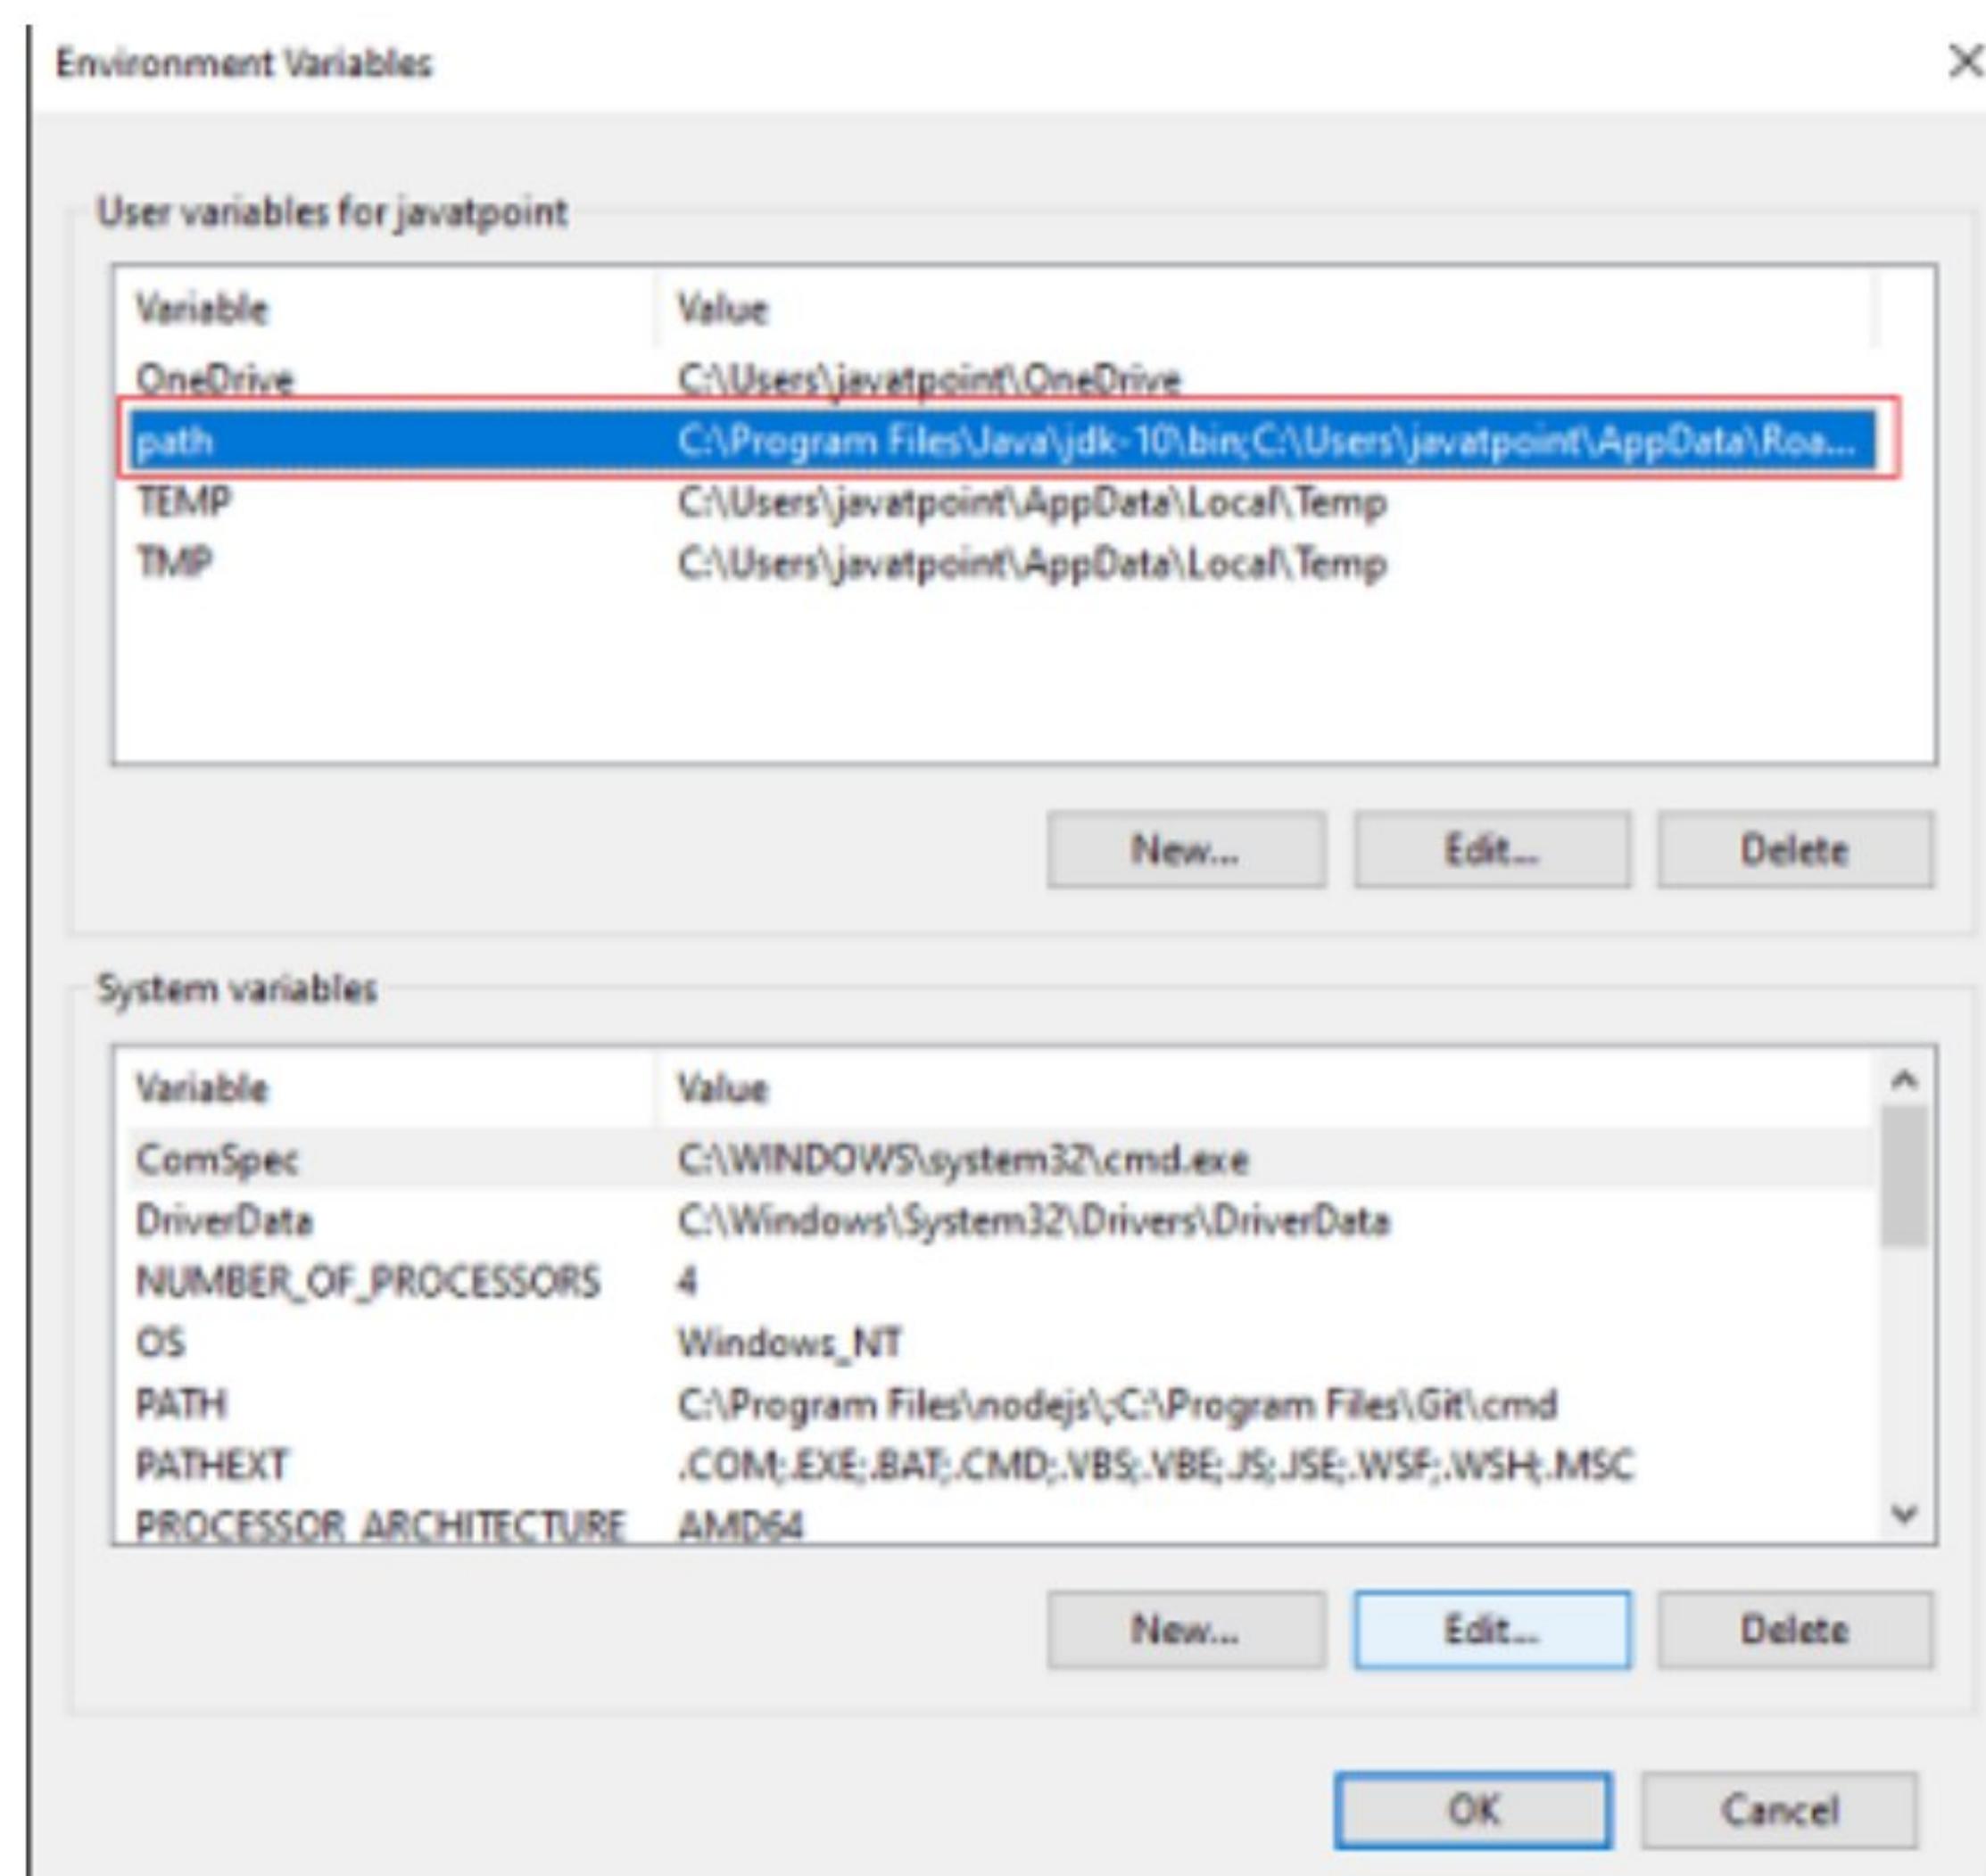

Step 2: Next, to download the latest Flutter SDK, click on the Windows icon. Here, you will find the download link for [SDK](#).

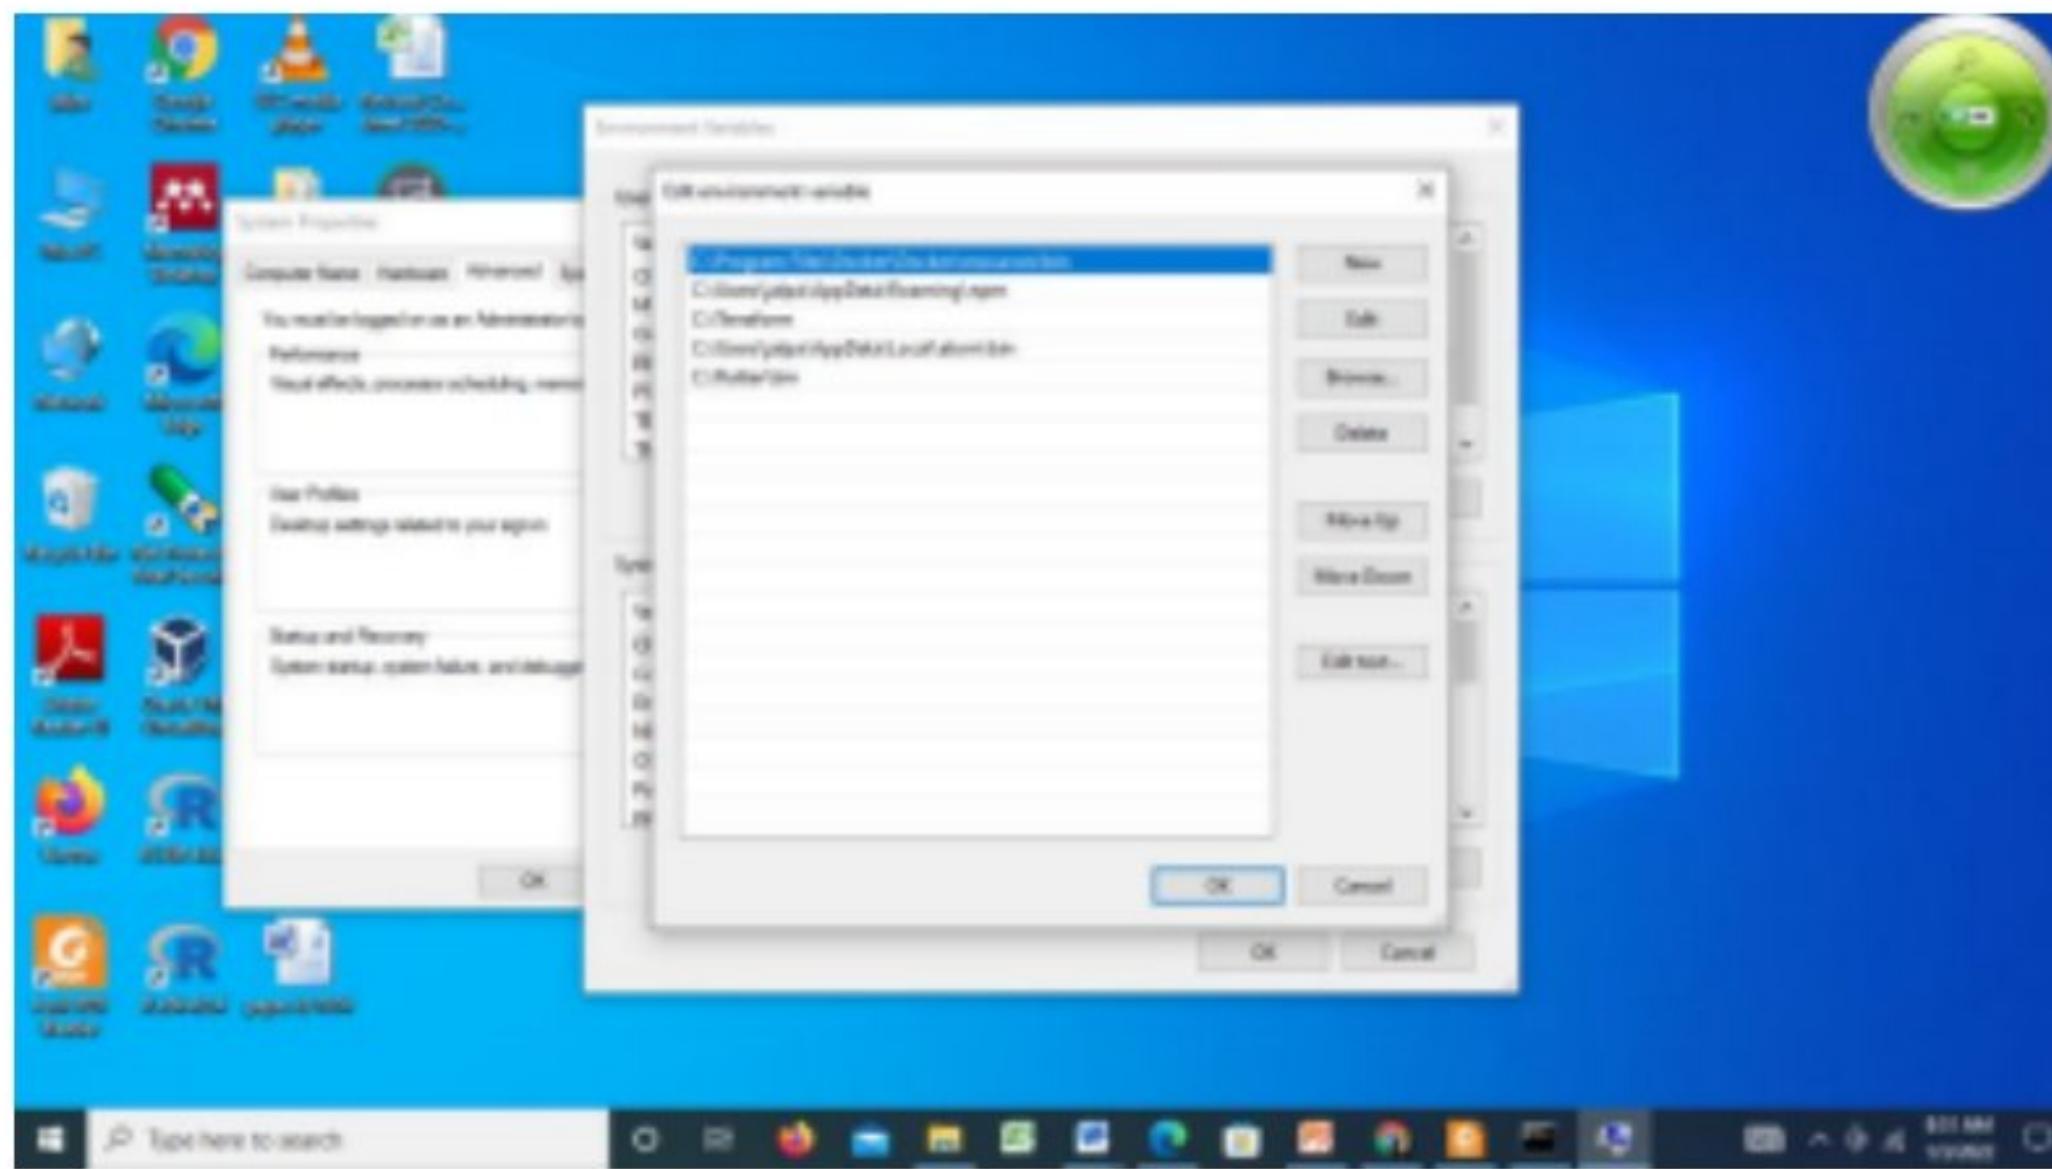

Step 3: When your download is complete, extract the **zip** file and place it in the desired installation folder or location, for example, C:/Flutter.

Step 4: To run the Flutter command in regular windows console, you need to update the system path to include the flutter bin directory. The following steps are required to do this:

Step 4.1: Go to MyComputer properties -> advanced tab -> environment variables. You will get the following screen.

Step 4.2: Now, select path -> click on edit. The following screen appears

Step 4.3: In the above window, click on New->write path of Flutter bin folder in variable value - > ok -> ok -> ok.

Step 5: Now, run the **\$ flutter** command in command prompt.

```
Microsoft Windows [Version 10.0.19042.1435]
(c) Microsoft Corporation. All rights reserved.

C:\Users\jalpa\Flutter
Manage your Flutter app development.

Common commands:
  flutter create [output directory]
    Create a new Flutter project in the specified directory.

  flutter run [options]
    Run your Flutter application on an attached device or in an emulator.

Usage: flutter <command> [<arguments>]

Global options:
  -h, --help          Print this usage information.
  -v, --verbose       noisy logging, including all shell commands executed.
                      If used with "--help", shows hidden options. If used with "flutter doctor", shows additional
                      diagnostic information. (use "-vv" to force verbose logging in those cases.)
  -d, --device-id     Target device id or name (prefixes allowed).
  --version           Reports the version of this tool.
  --suppress-analytics Suppress analytics reporting when this command runs.

Available commands:

Flutter SDK
  bash-completion      Output command line shell completion setup scripts.
  channel              List or switch Flutter channels.
  config               Configure Flutter settings.
  doctor               Show information about the installed tooling.
  downgrade            Downgrade Flutter to the last active version for the current channel.
  precache              Populate the Flutter tool's cache of binary artifacts.
  upgrade              Upgrade your copy of Flutter.

Project
  analyze              Analyze the project's Dart code.
  assemble             Assemble and build Flutter resources.
  build                Build an executable app or install bundle.
  clean                Delete the build/ and .dart_tool/ directories.
  create               Create a new Flutter project.
  drive                Run integration tests for the project on an attached device or emulator.
  format               Format one or more Dart files.
```

Now, run the **\$ flutter doctor** command. This command checks for all the requirements of Flutter app development and displays a report of the status of your Flutter installation.

```
C:\Users\jalpa>
C:\Users\jalpa>
C:\Users\jalpa>flutter doctor
Running "Flutter pub get" in flutter_tools...                                37.86
Doctor summary (to see all details, run flutter doctor -v):
[!] Flutter (Channel stable, 2.0.1, on Microsoft Windows [Version 10.0.19042.1485], locale en-US)
[!] Android toolchain - develop for Android devices
    ✘ unable to locate Android SDK.
      Install Android Studio from: https://developer.android.com/studio/index.html
      On first launch it will assist you in installing the Android SDK components.
      (or visit https://flutter.dev/docs/get-started/install/windows/android-setup for detailed instructions).
      If the Android SDK has been installed to a custom location, please use
      'flutter config --android-sdk' to update to that location.

[!] Chrome - develop for the web

C:\Users\jalpa>flutter doctor
Doctor summary (to see all details, run flutter doctor -v):
[!] Flutter (Channel stable, 2.0.1, on Microsoft Windows [Version 10.0.19042.1485], locale en-US)
[!] Android toolchain - develop for android devices (Android NDK version 22.0.8)
    ✘ cmdline-tools component is missing
      Run 'path\to\ sdkmanager --install "cmdline-tools;latest"'
      See https://developer.android.com/studio/command-line for more details.
    ✘ android license status unknown.
      Run 'flutter doctor --android-licenses' to accept the SDK licenses.
      See https://flutter.dev/docs/get-started/install/windows/android-setup for more details.

[!] Chrome - develop for the web
[!] Android Studio (version 2020.3)
[!] VS Code (version 1.55.2)
[!] Connected device (2 available)

Doctor found issues in 3 categories.
```

Step 6: When you run the above command, it will analyze the system and show its report, as shown in the below image. Here, you will find the details of all missing tools, which required to run Flutter as well as the development tools that are available but not connected with the device.

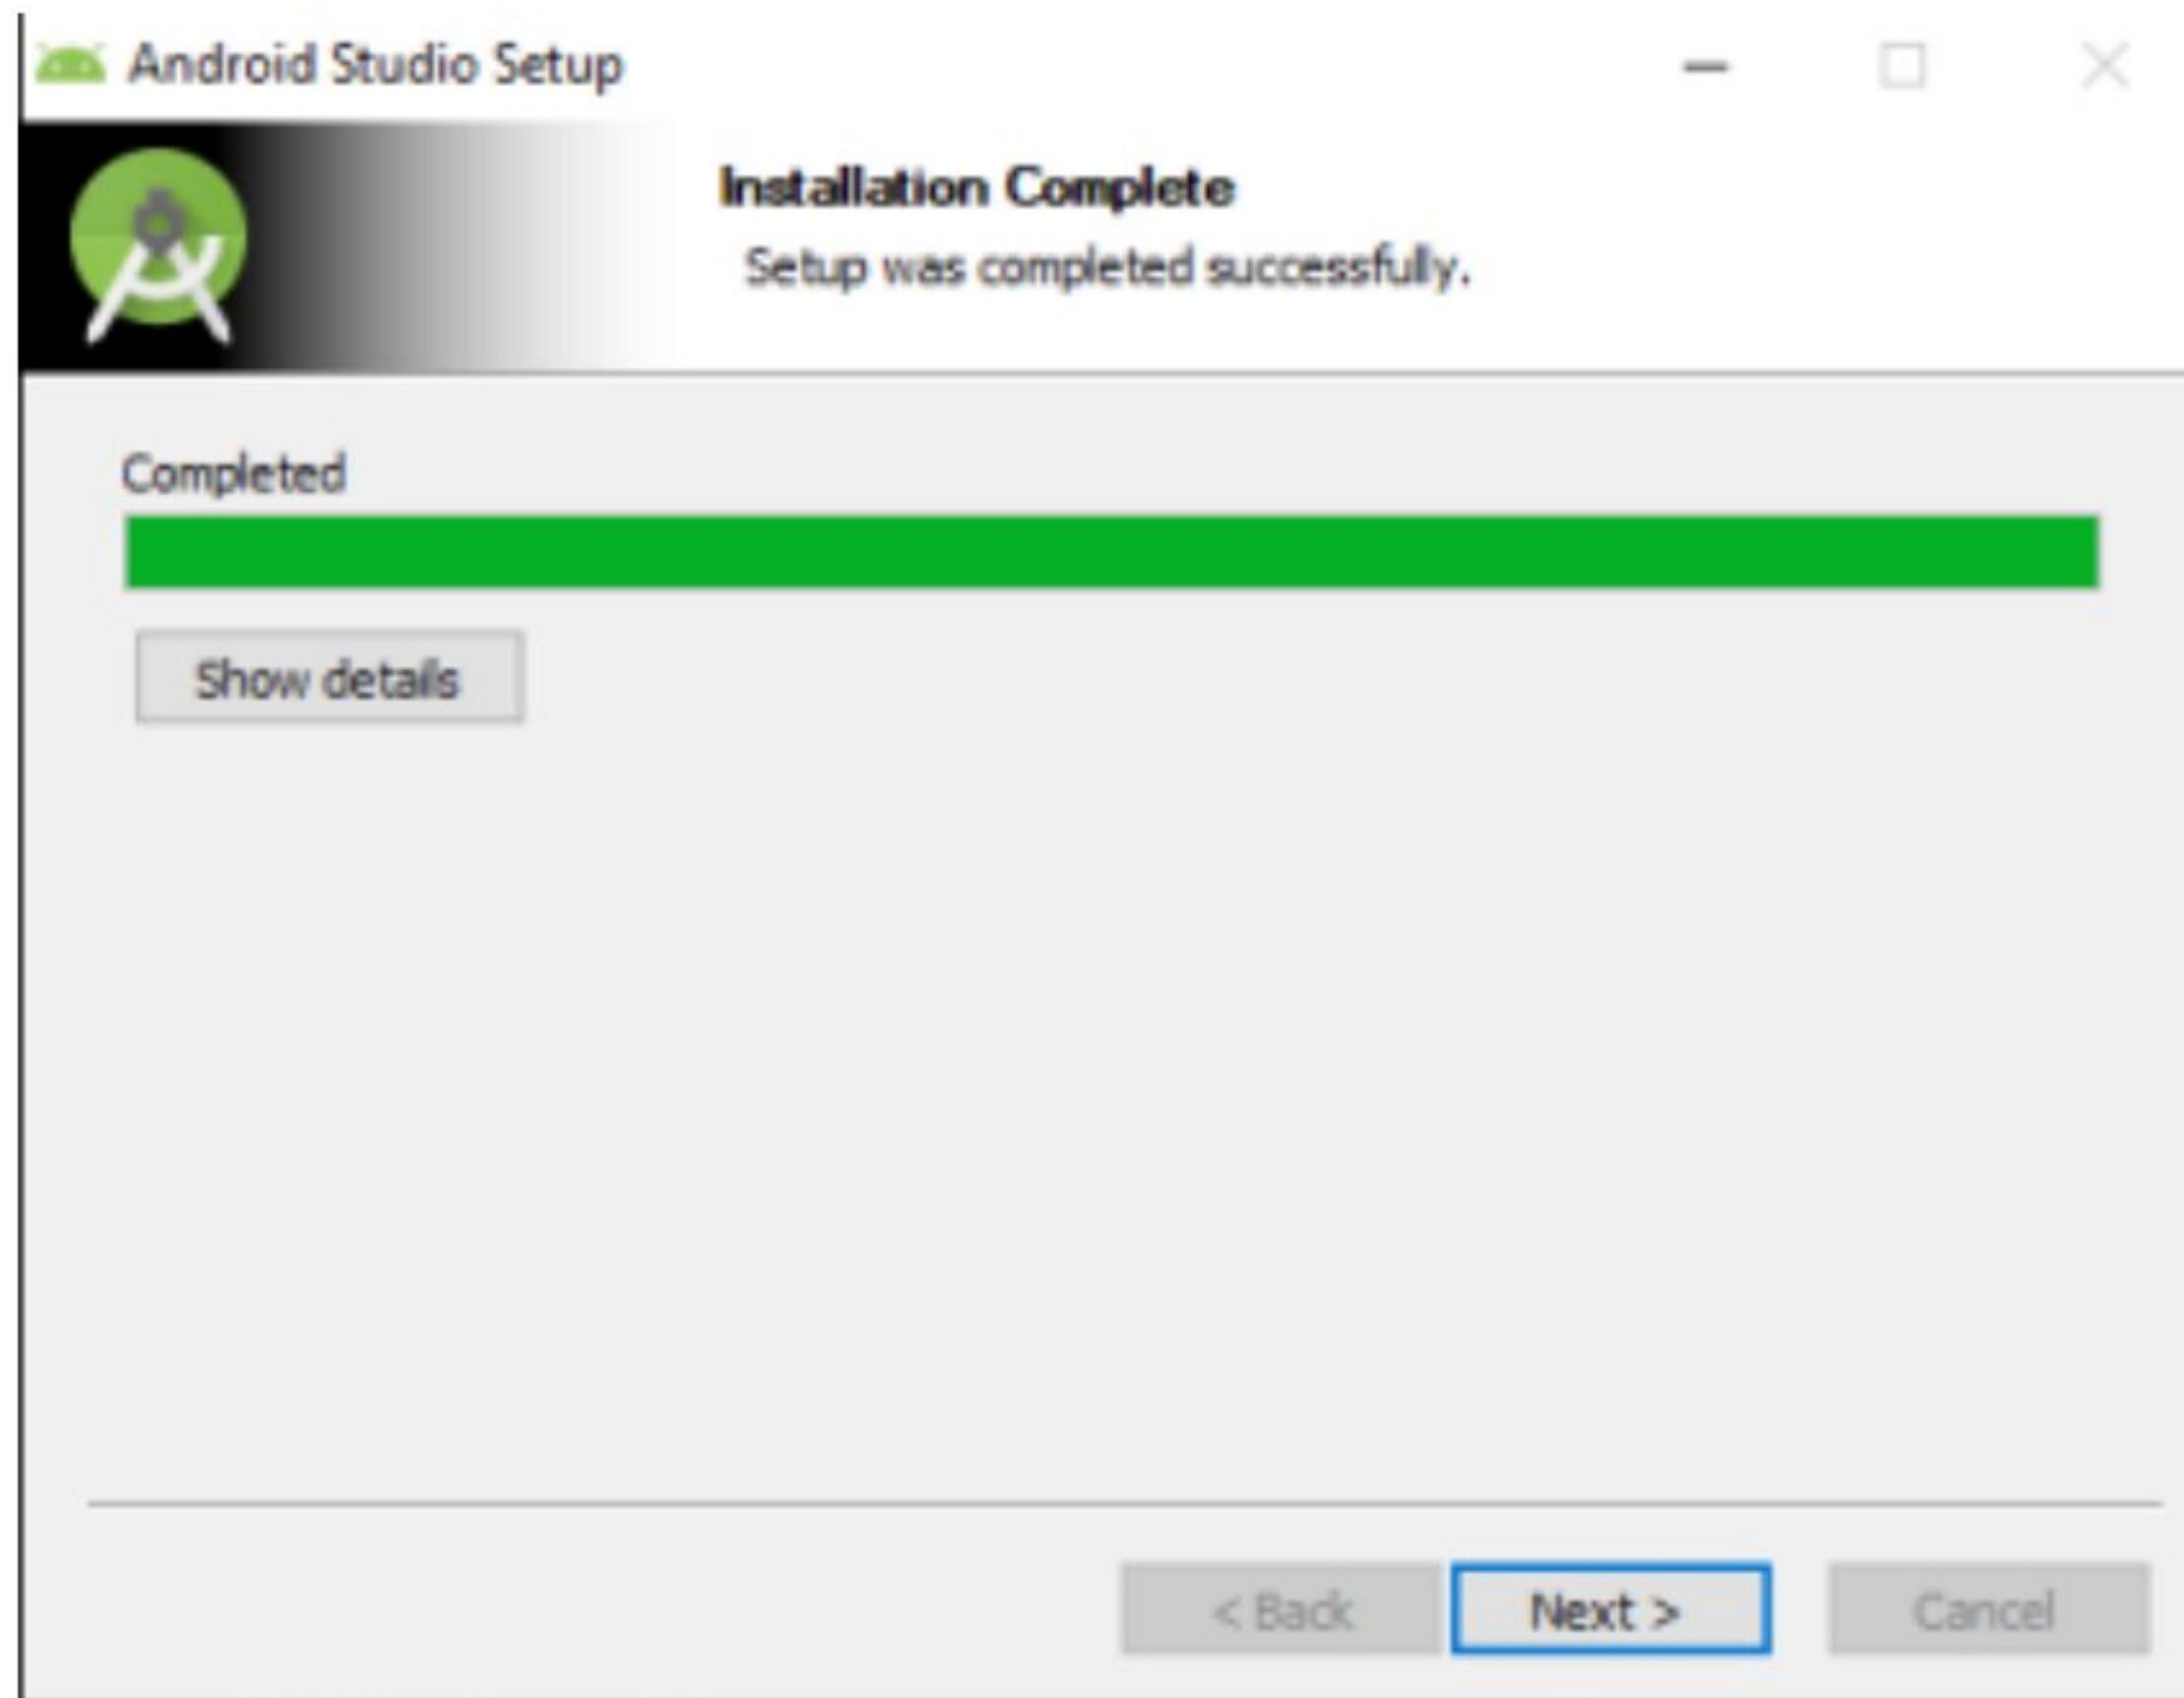

Step 7: Install the Android SDK. If the flutter doctor command does not find the Android SDK tool in your system, then you need first to install the Android Studio IDE. To install Android Studio IDE, do the following steps.

Step 7.1: Download the latest Android Studio executable or zip file from the [official site](#).

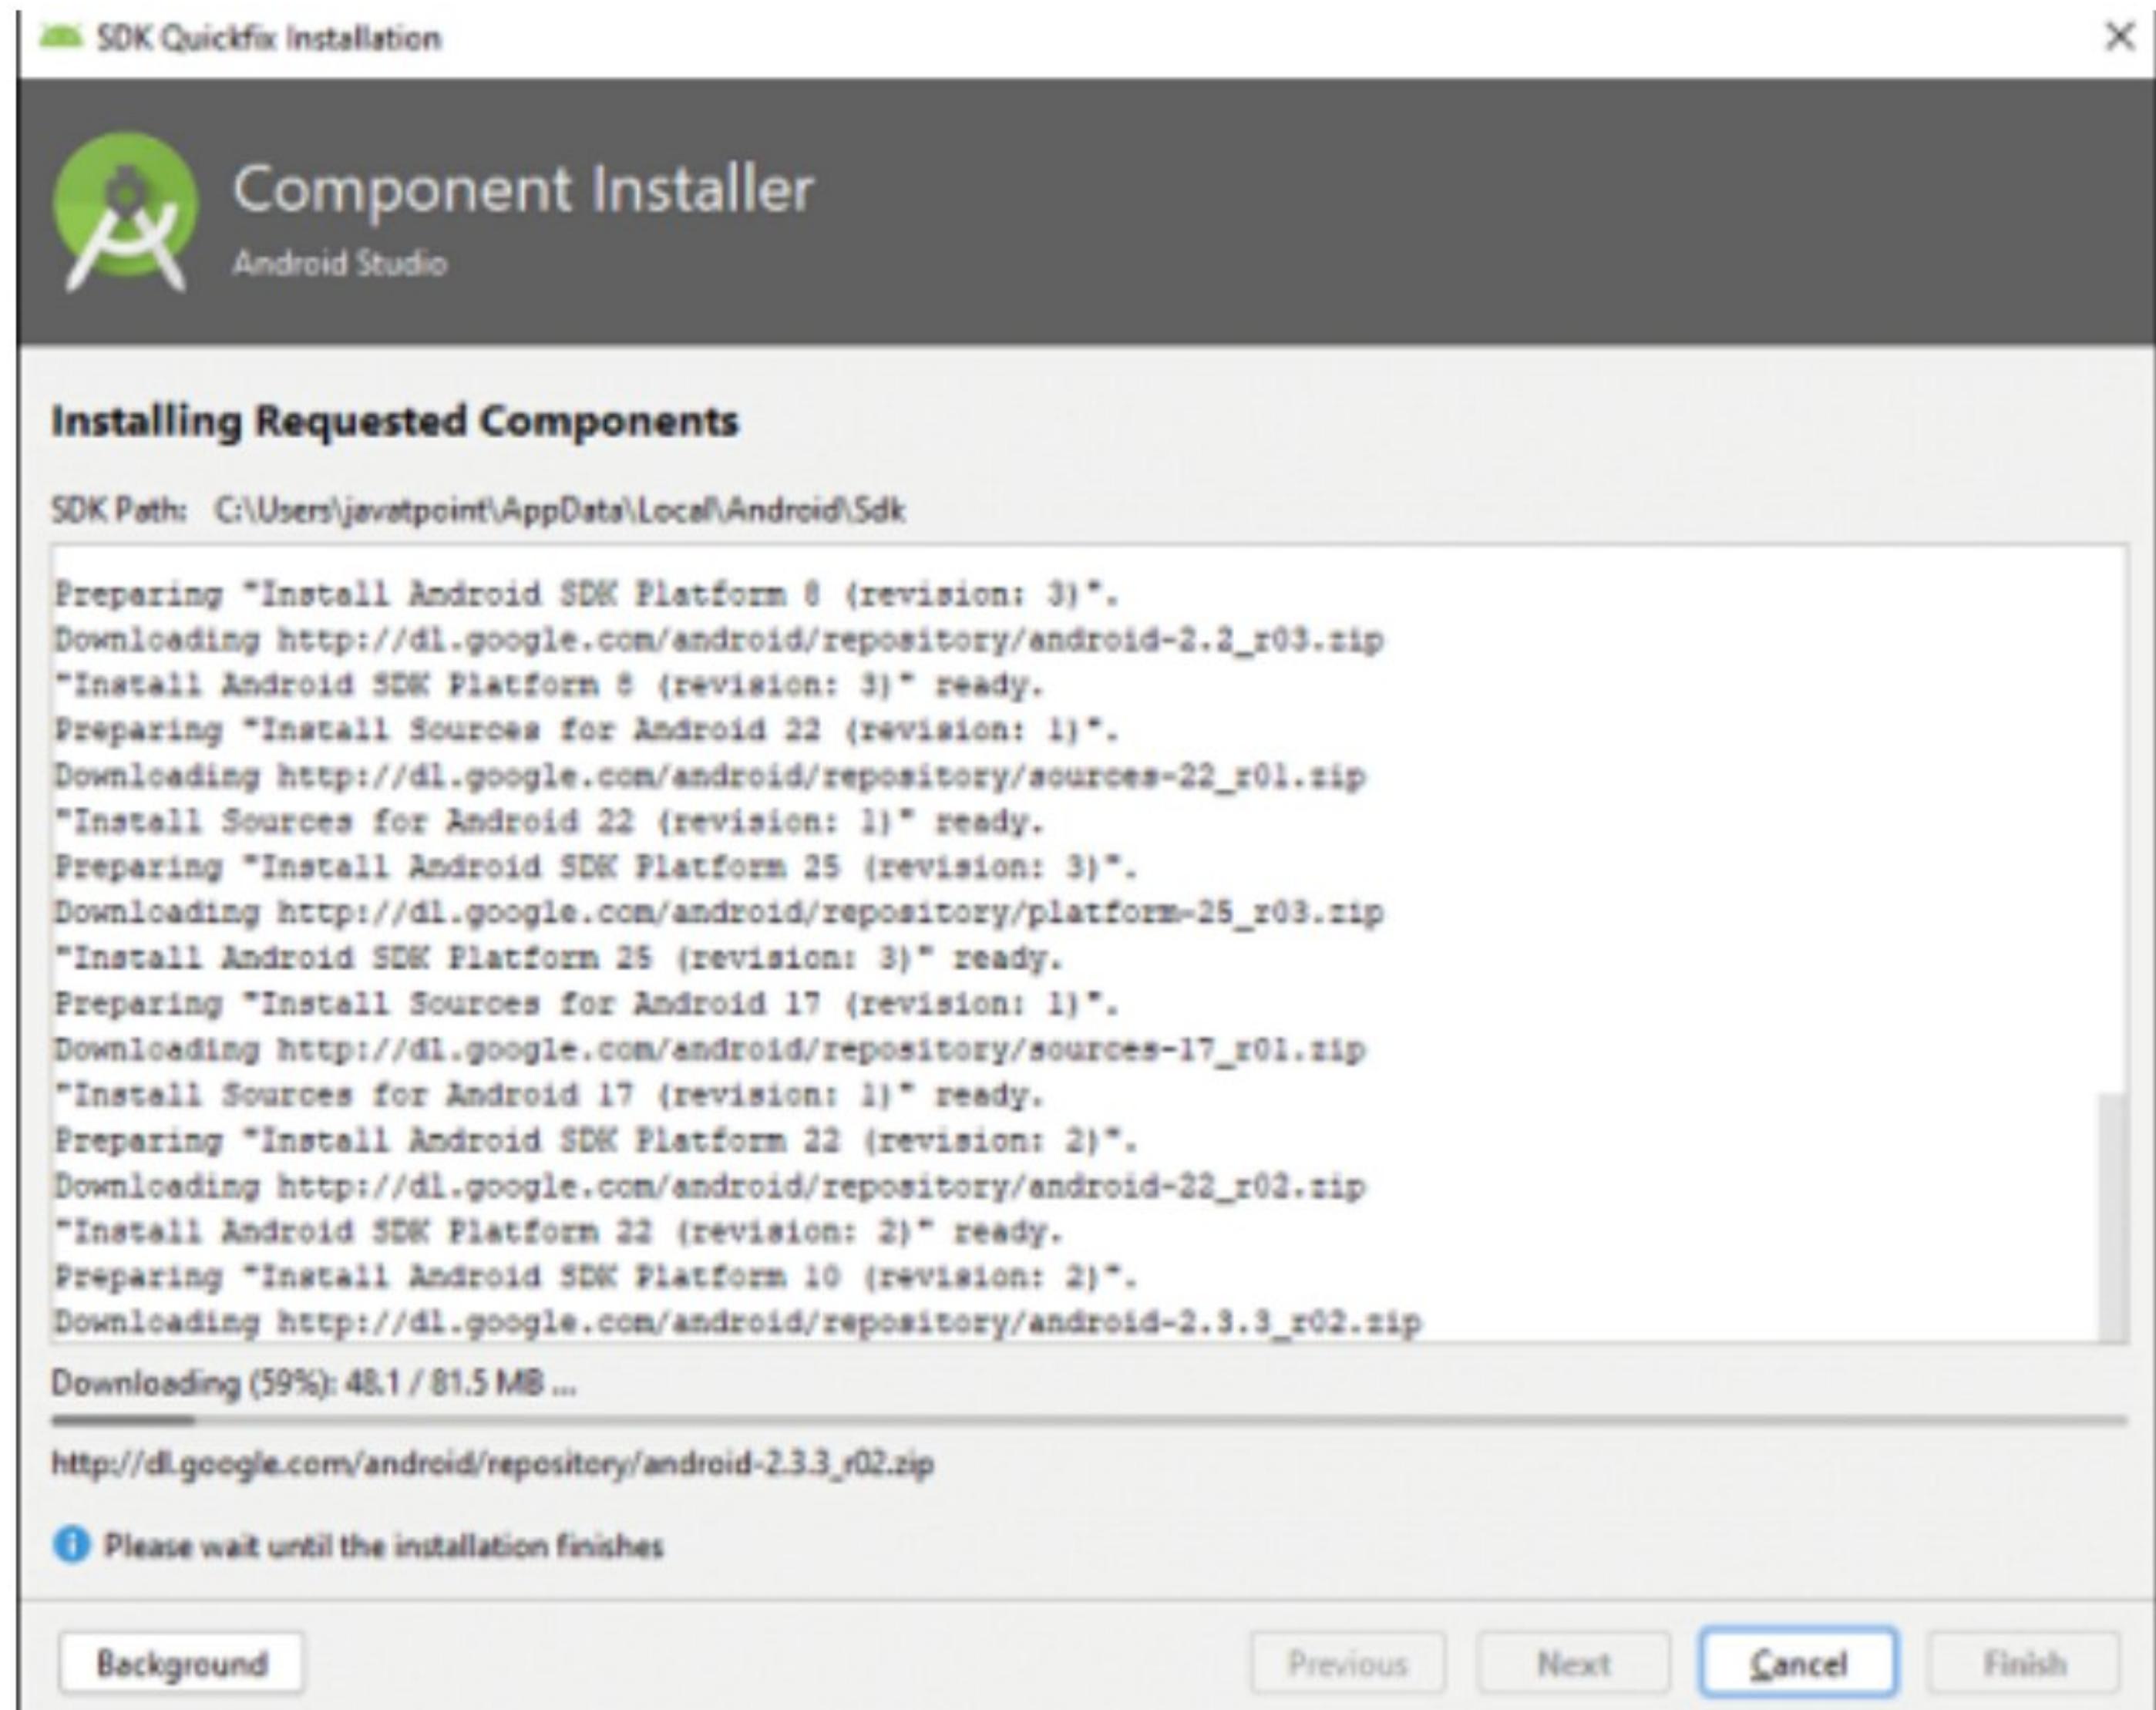

Step 7.2: When the download is complete, open the .exe file and run it. You will get the following dialog box.

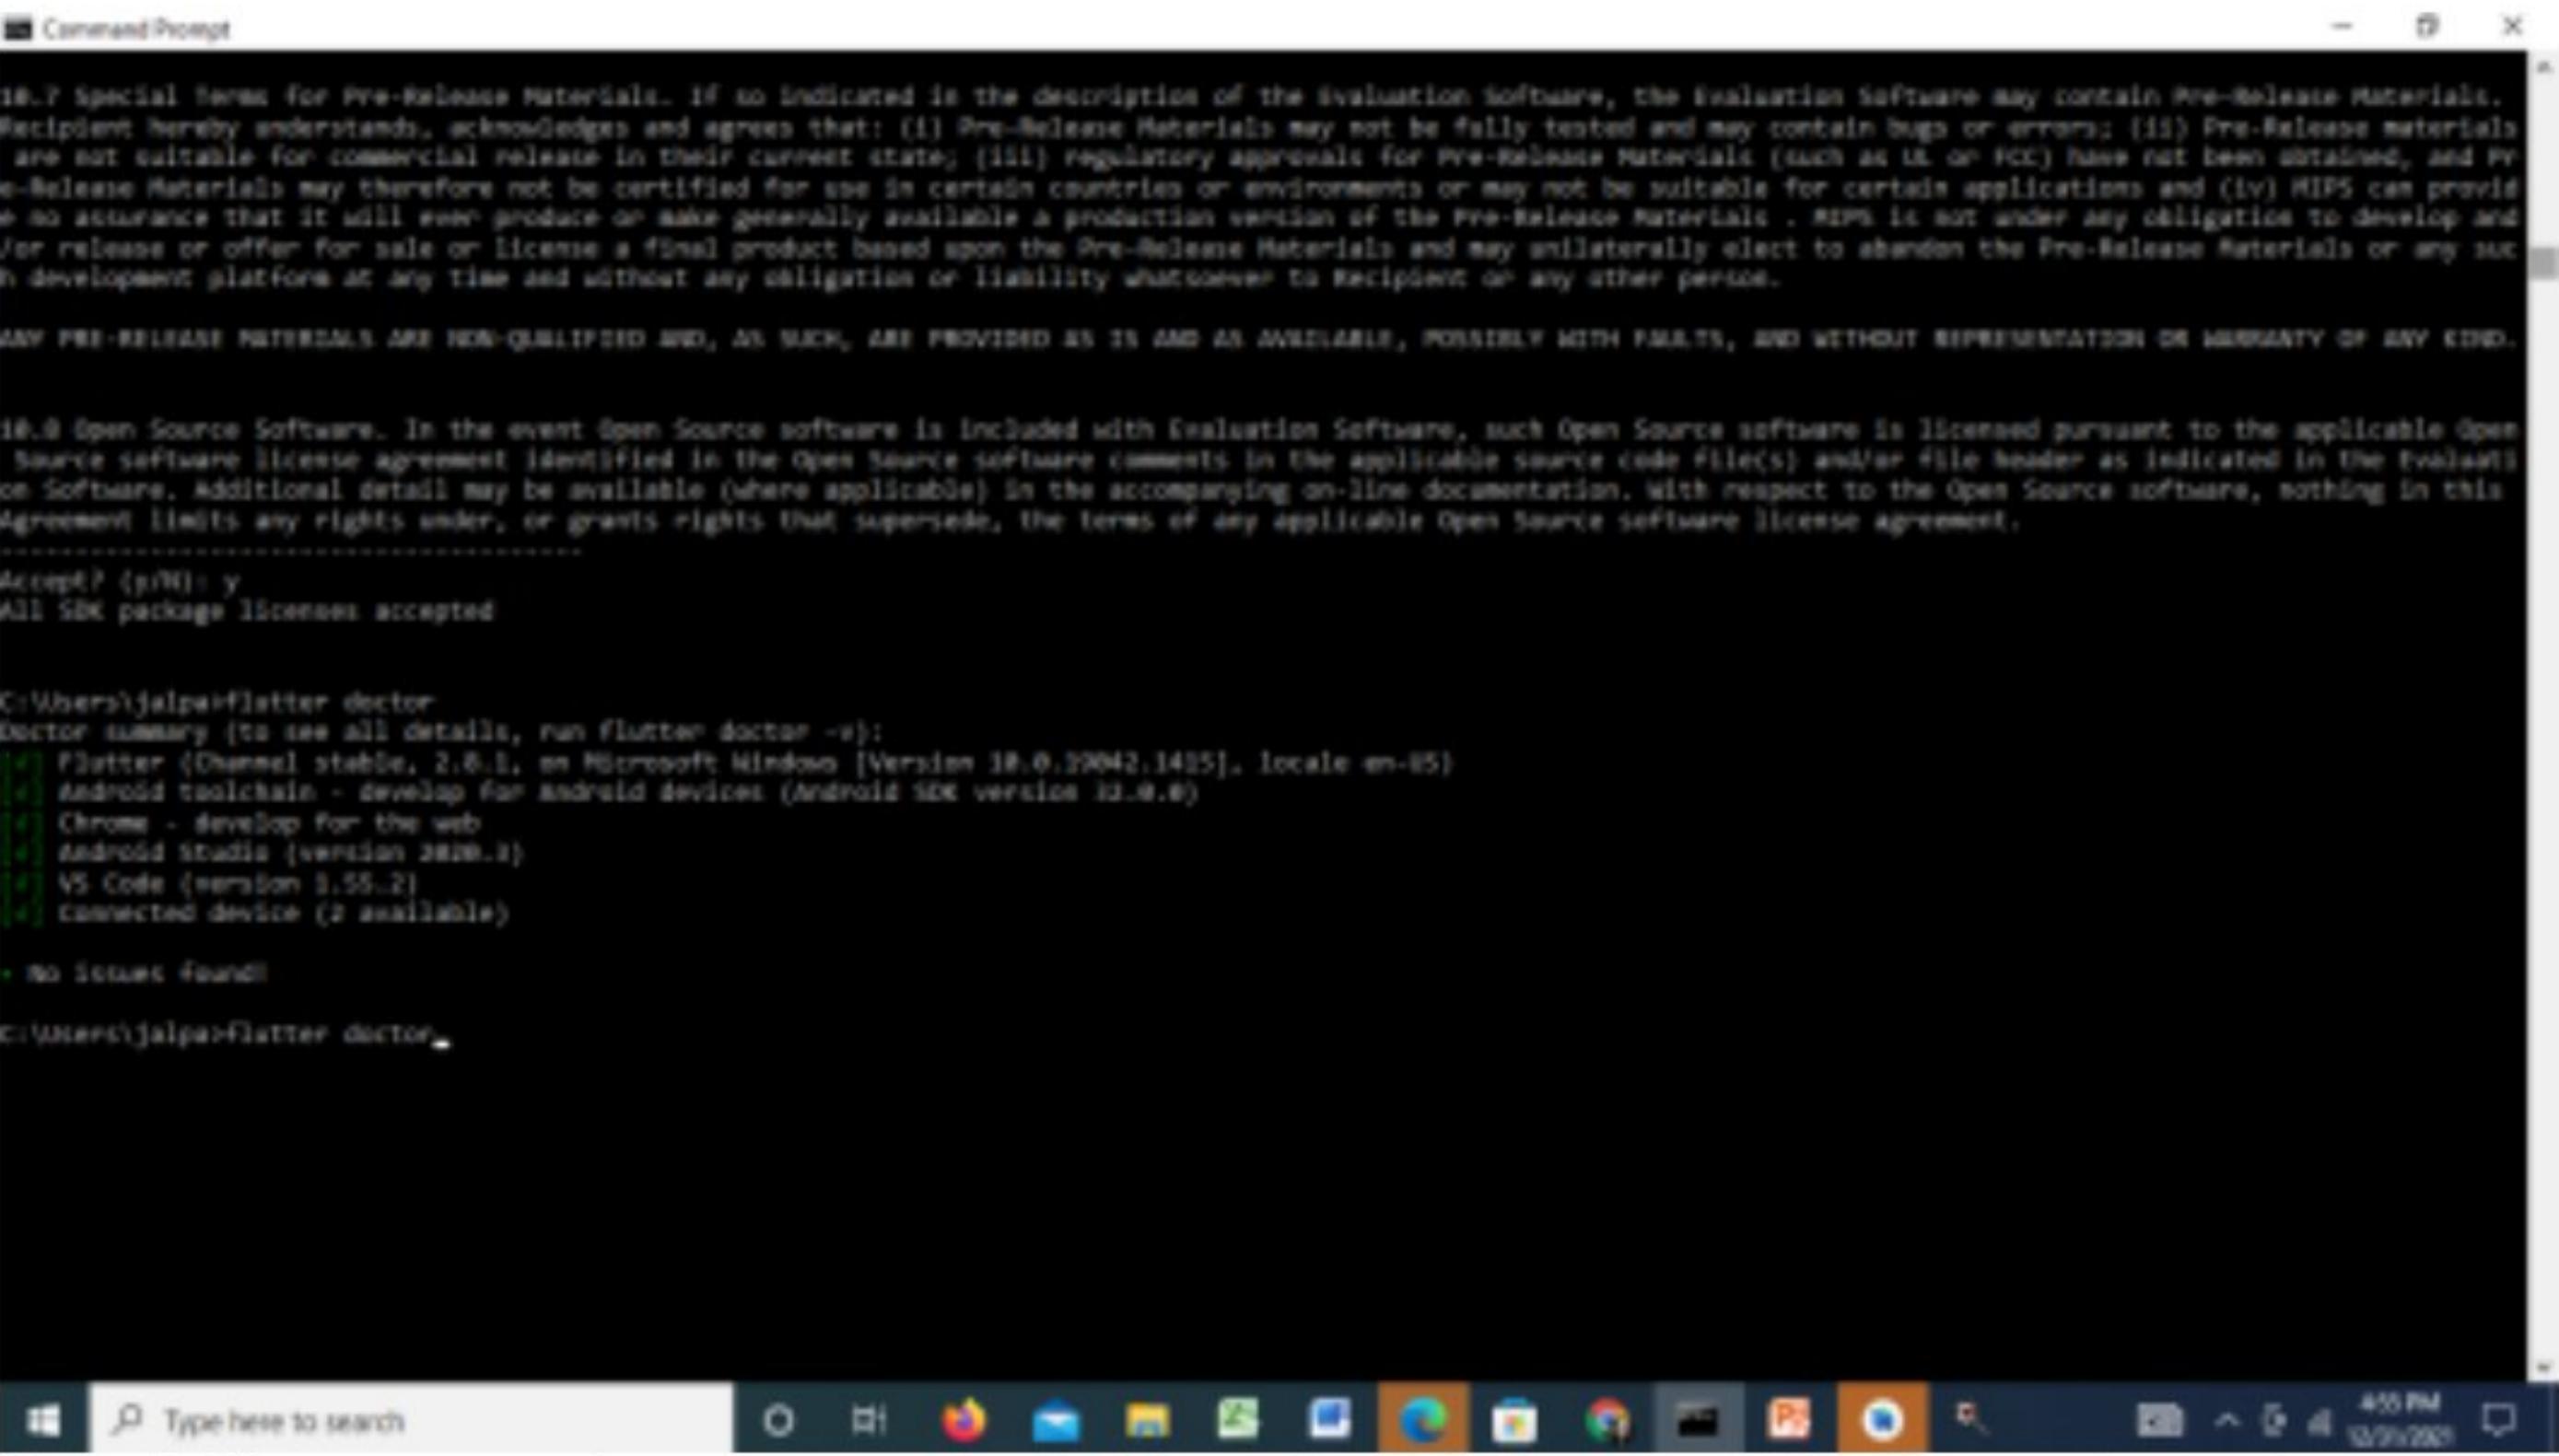

Step 7.3: Follow the steps of the installation wizard. Once the installation wizard completes, you will get the following screen.

Step 7.4: In the above screen, click Next-> Finish. Once the Finish button is clicked, you need to choose the 'Don't import Settings option' and click OK. It will start the Android Studio.

Step 7.5 run the `$ flutter doctor` command and Run `flutter doctor --android-licenses` command.

```
Command Prompt
M&T Special Terms for Pre-Release Materials.. If no indication is in the description of the evaluation software, the evaluation software may contain Pre-Release Materials. Recipient hereby understands, acknowledges and agrees that: (i) Pre-Release Materials may not be fully tested and may contain bugs or errors; (ii) Pre-Release materials are not suitable for commercial release in their current state; (iii) regulatory approvals for Pre-Release Materials (such as UL or FCC) have not been obtained, and Pre-Release Materials may therefore not be certified for use in certain countries or environments or may not be suitable for certain applications and (iv) M&T can provide no assurance that it will ever produce or make generally available a production version of the Pre-Release Materials . M&T is not under any obligation to develop and/or release or offer for sale or license a final product based upon the Pre-Release Materials and may unilaterally elect to abandon the Pre-Release Materials or any such development platform at any time and without any obligation or liability whatsoever to Recipient or any other person.

ANY PRE-RELEASE MATERIALS ARE NON-QUALIFIED AND, AS SUCH, ARE PROVIDED AS IS AND AS AVAILABLE, POSSIBLY WITH FAULTS, AND WITHOUT REPRESENTATION OR WARRANTY OF ANY KIND.

M&T Open Source Software.. In the event Open Source software is included with Evaluation Software, such Open Source software is licensed pursuant to the applicable Open Source software license identified in the Open Source software comments in the applicable source code file(s) and/or file header as indicated in the Evaluation Software. Additional detail may be available (where applicable) in the accompanying on-line documentation. With respect to the Open Source software, nothing in this Agreement limits any rights under, or grants rights that supersede, the terms of any applicable Open Source software license agreement.

Accept? (y/N): y
All Sdk package licenses accepted

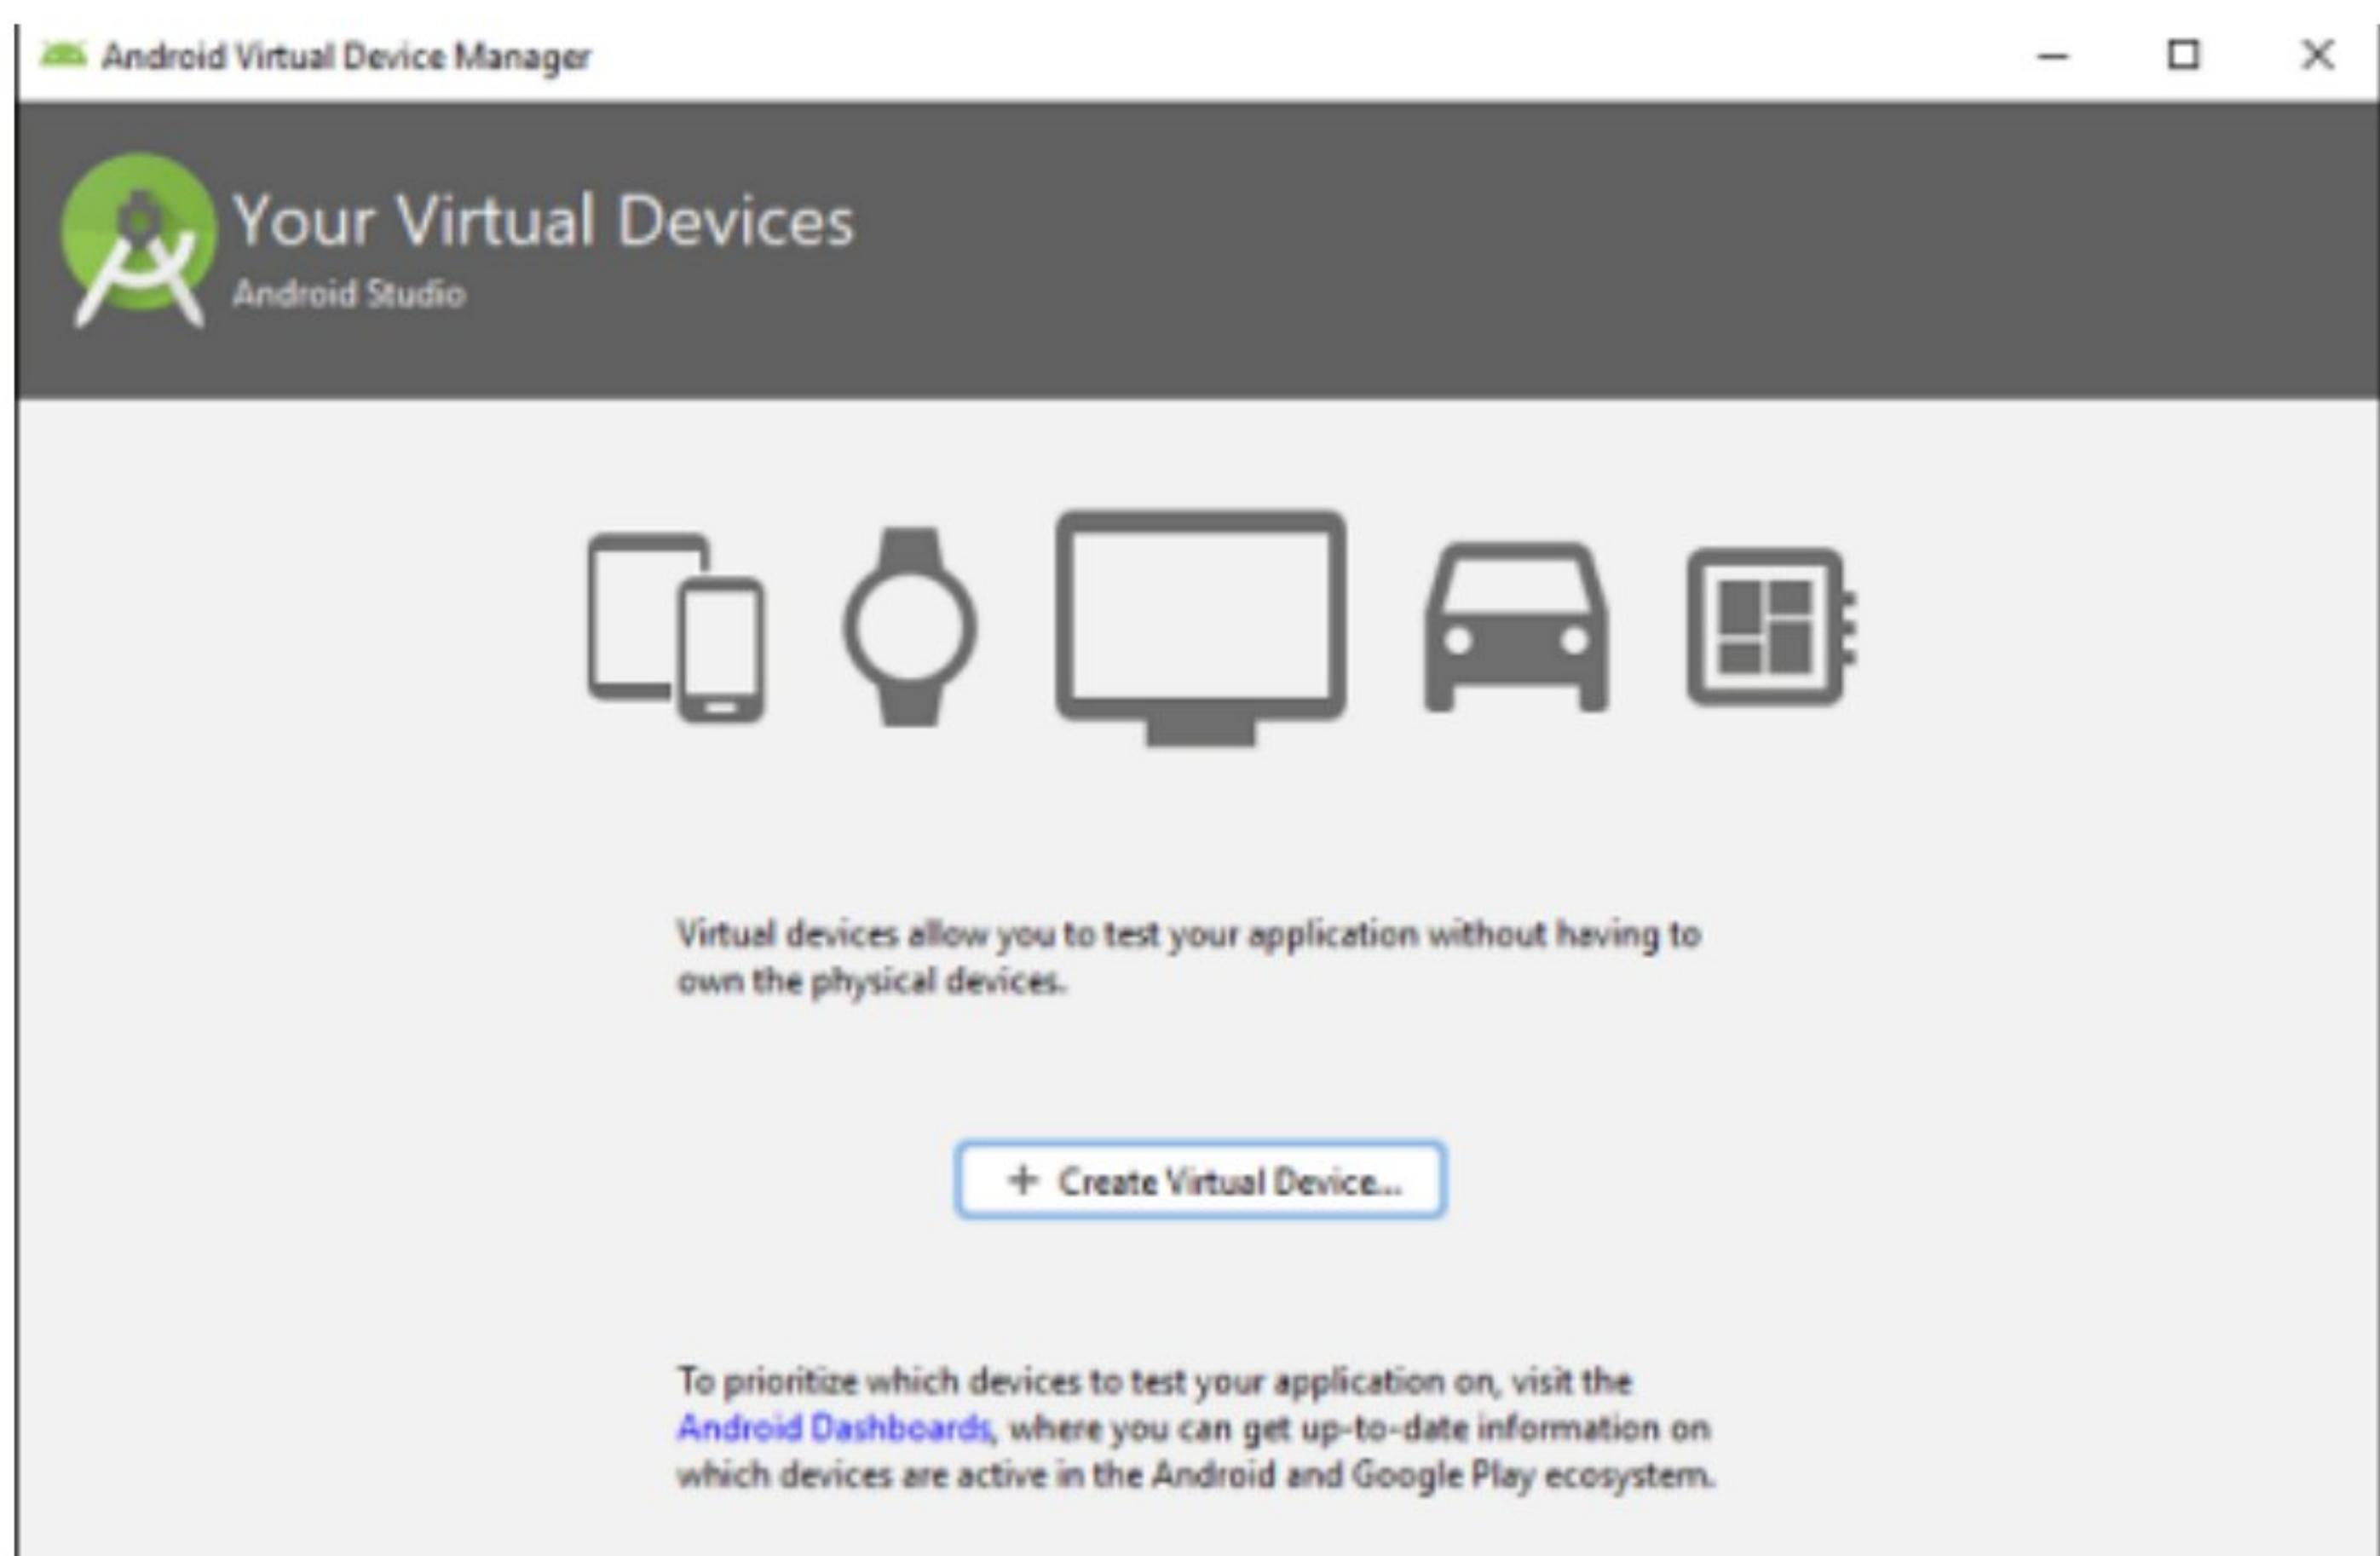

C:\Users\jalpa\flutter> flutter doctor
Doctor summary (to see all details, run flutter doctor -v):
[✓] Flutter (Channel stable, 2.6.1, on Microsoft Windows [Version 10.0.22042.1485], locale en-US)
[✓] Android toolchain - develop for android devices (Android SDK version 32.0.0)
[✓] Chrome - develop for the web
[✓] Android Studio (version 3.6.2)
[✓] VS Code (version 1.55.2)
[✓] connected device (2 available)

- no issues found!

C:\Users\jalpa\flutter>
```

Step 8: Next, you need to set up an Android emulator. It is responsible for running and testing the Flutter application.

Step 8.1: To set an Android emulator, go to Android Studio > Tools > Android > AVD Manager and select Create Virtual Device. Or, go to Help->Find Action->Type Emulator in the search box. You will get the following screen.

To prioritize which devices to test your application on, visit the [Android Dashboards](#), where you can get up-to-date information on which devices are active in the Android and Google Play ecosystem.

Step 8.2: Choose your device definition and click on Next.

Step 8.3: Select the system image for the latest Android version and click on Next.

Step 8.4: Now, verify the all AVD configuration. If it is correct, click on Finish. The following screen appears.

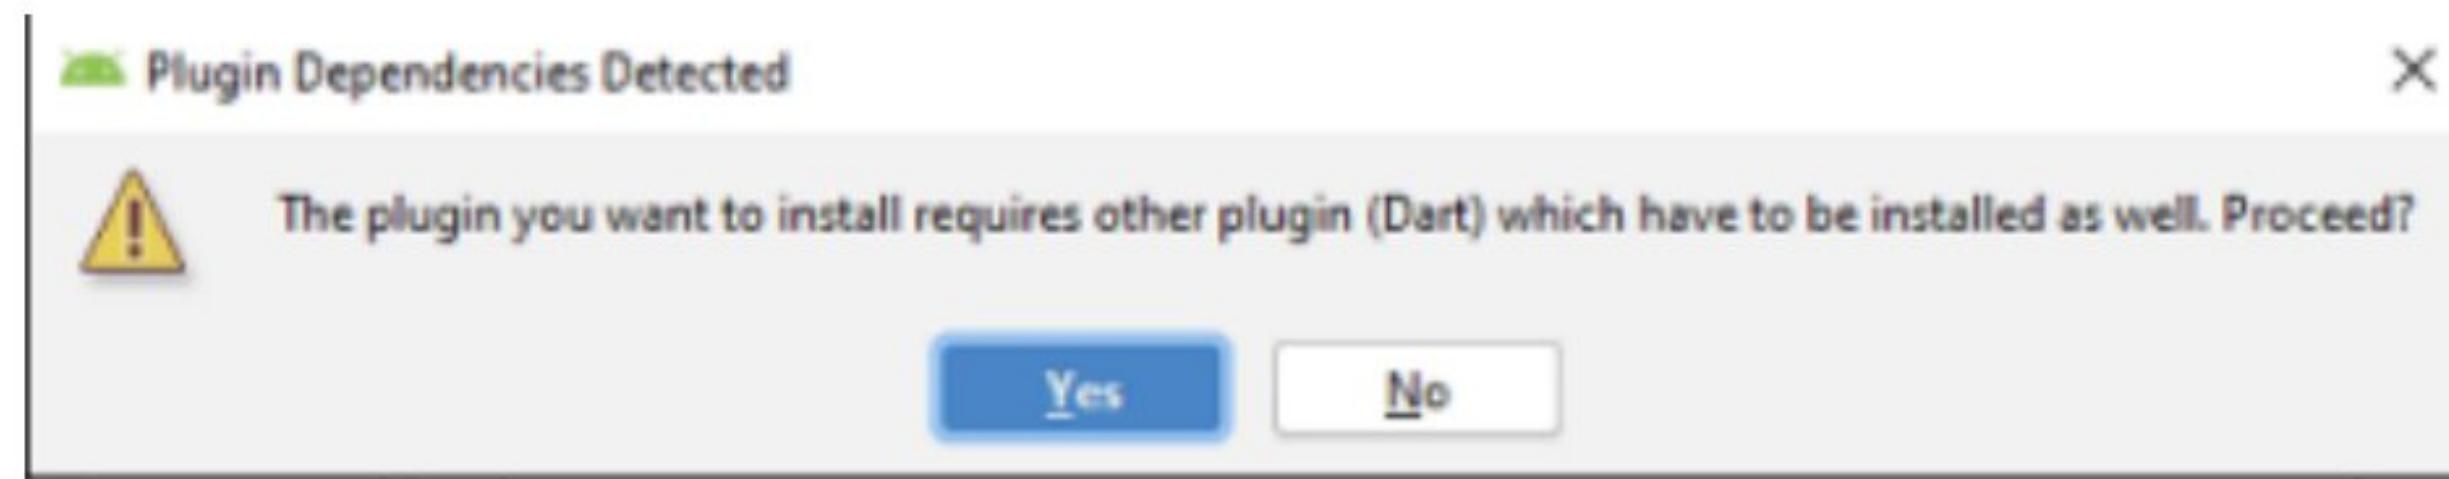

Step 8.5: Last, click on the icon pointed into the red color rectangle. The Android emulator displayed as below screen.

Step 9: Now, install Flutter and Dart plugin for building Flutter application in Android Studio. These plugins provide a template to create a Flutter application, give an option to run and debug Flutter application in the Android Studio itself. Do the following steps to install these plugins.

Step 9.1: Open the Android Studio and then go to File->Settings->Plugins.

Step 9.2: Now, search the Flutter plugin. If found, select Flutter plugin and click install. When you click on install, it will ask you to install Dart plugin as below screen. Click yes to proceed.

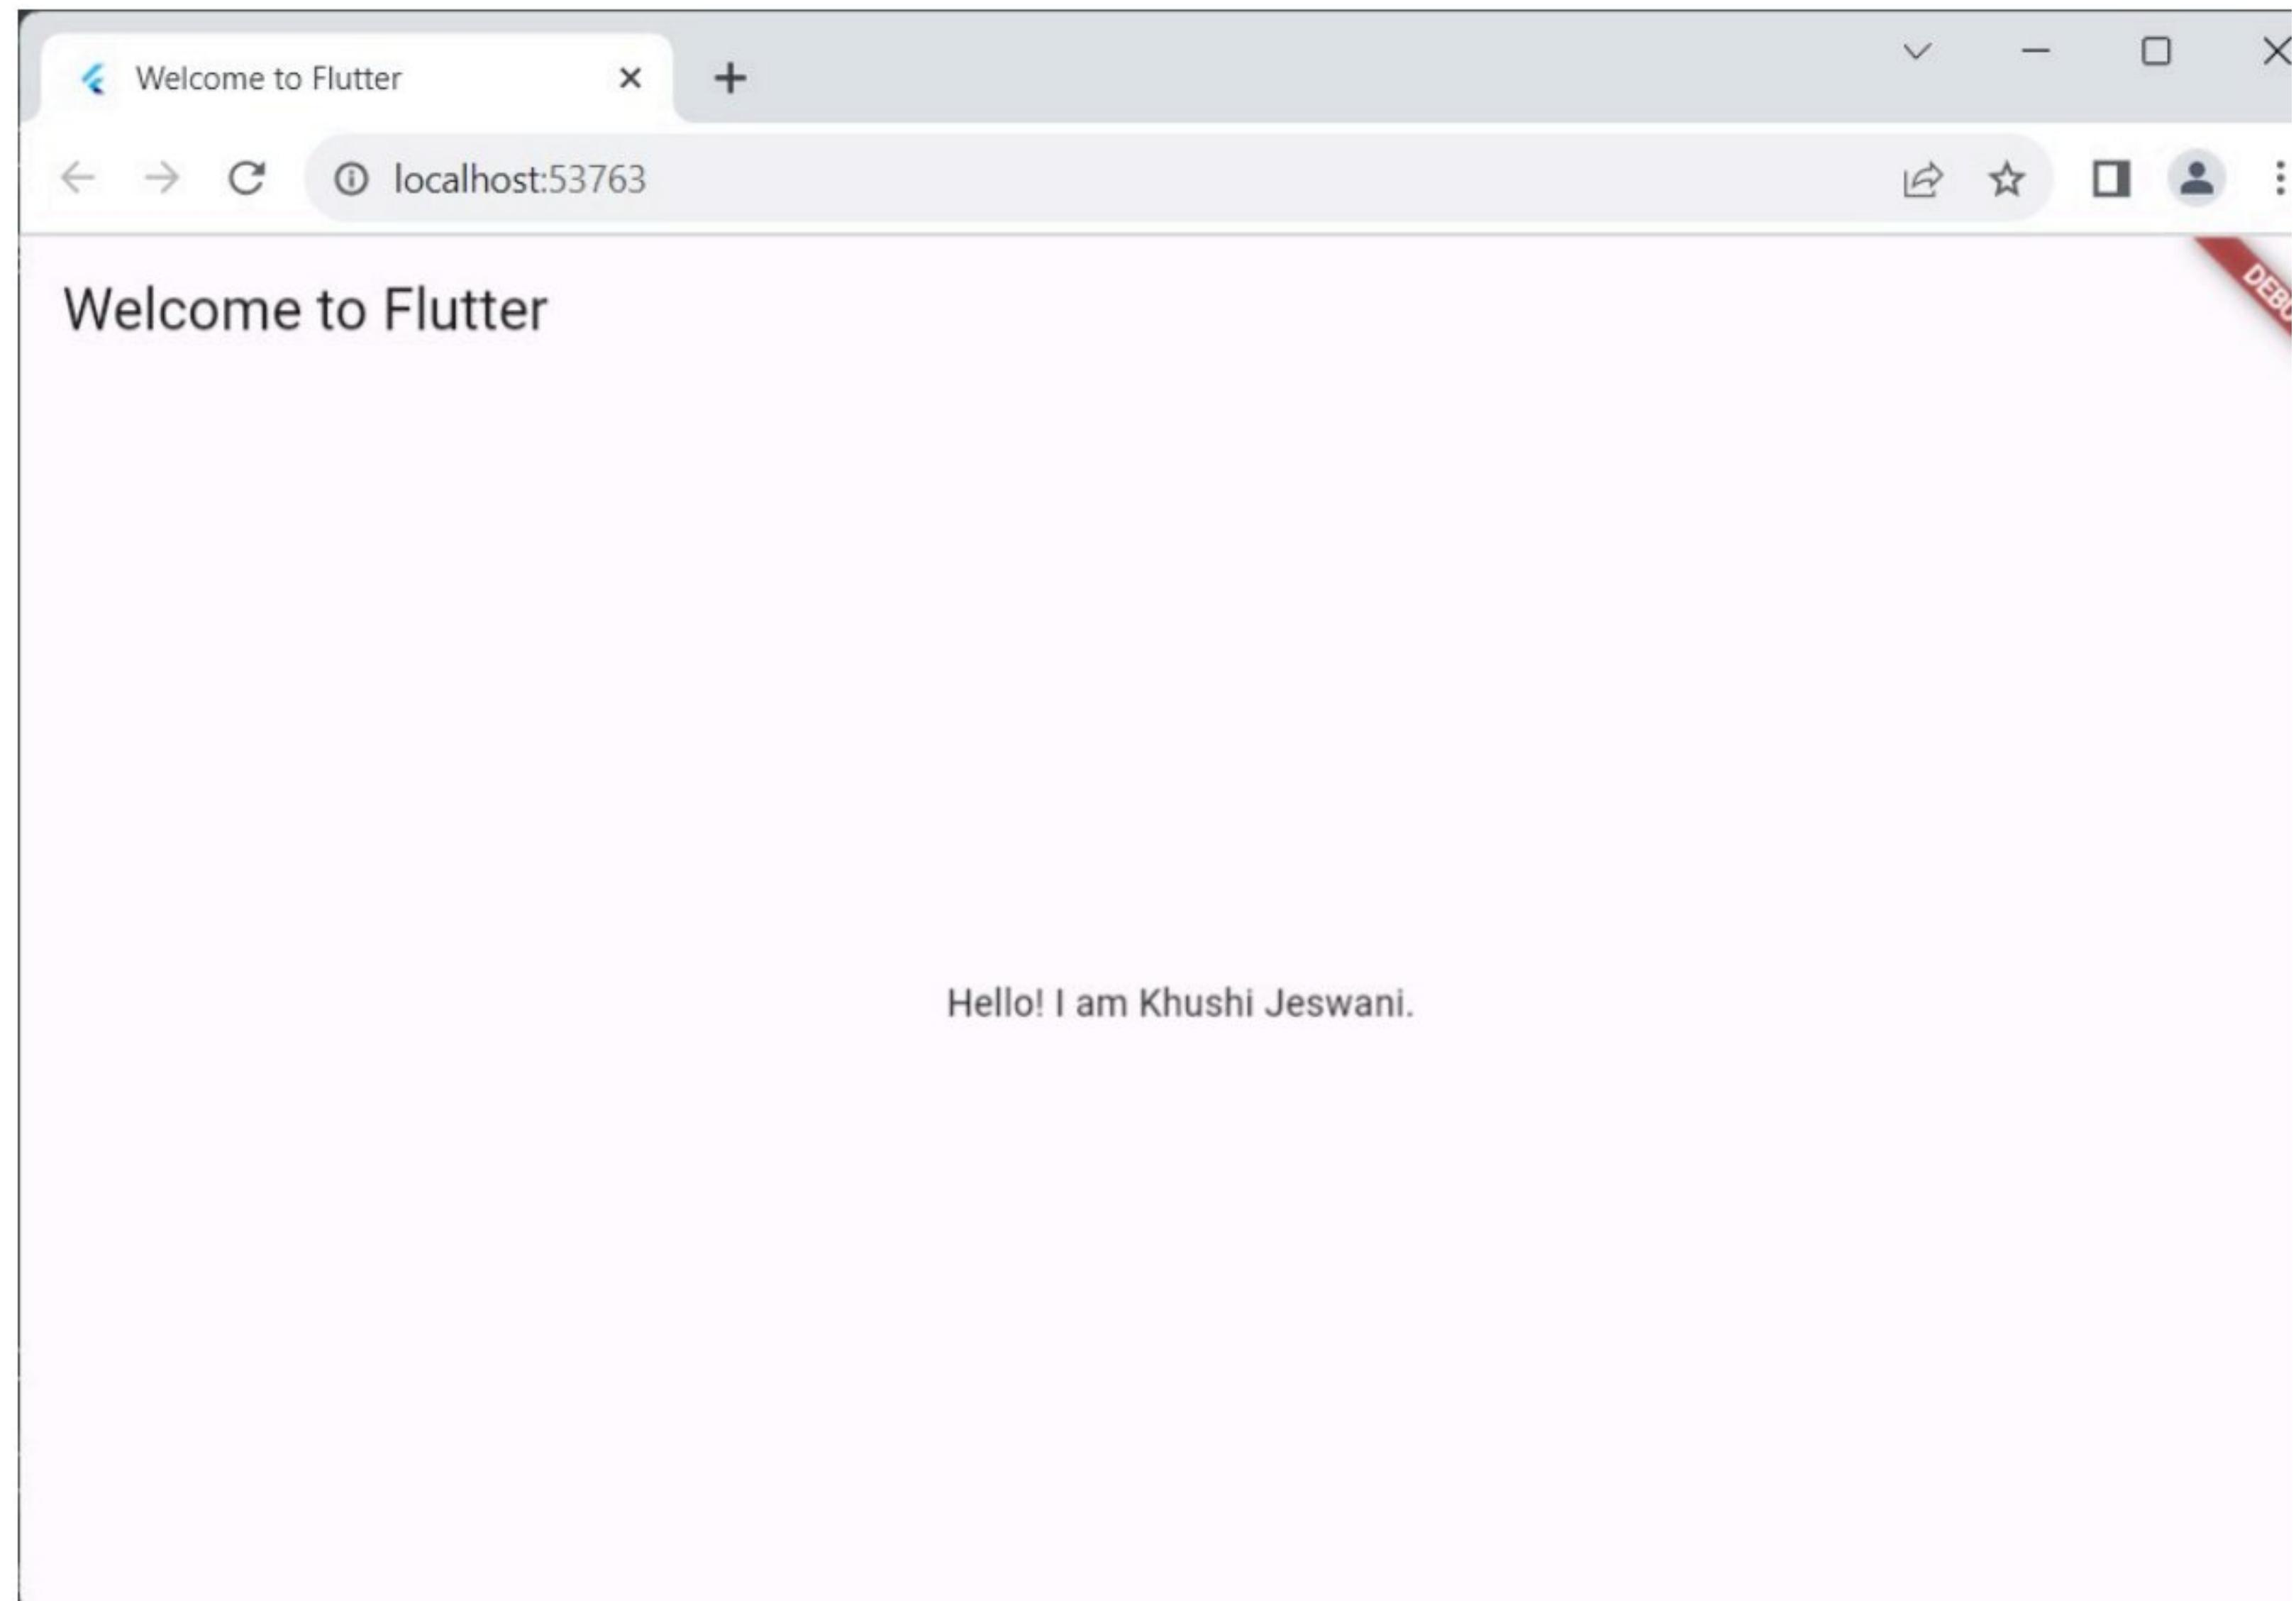

Step 9.3: Restart the Android Studio.

Code:

```
import 'package:flutter/material.dart';
void main() {
  runApp(const MyApp());
}

class MyApp extends StatelessWidget {
  const MyApp({Key? key}) : super(key: key);
  @override
  Widget build(BuildContext context) {
    return MaterialApp(
      title: 'Welcome to Flutter',
      home: Scaffold(
        appBar: AppBar(
          title: const Text('Welcome to Flutter'),
        ),
        body: const Center(
          child: Text('Vedang Khandagale'),
        ),
      );
  }
}
```

Output

Conclusion: Hence We ran a simple program on running a simple text, on flutter, running on a virtual device

MAD & PWA Lab Journal

Experiment No.	02
Experiment Title.	To design Flutter UI by including common widgets.
Roll No.	26
Name	Khushi Jeswani
Class	D15A
Subject	MAD & PWA Lab
Lab Outcome	LO2: Design and Develop interactive Flutter App by using widgets, layouts, gestures and animation
Grade:	10

Experiment 2:

Name: Khushi Jeswani

Div: D15A

Roll no: 26

Aim: To design Flutter UI by including common widgets.

Theory: In Flutter, widgets are the building blocks of the user interface, and several common widgets play crucial roles in creating engaging and interactive applications. Here's a brief overview of some fundamental Flutter widgets:

Container: The most basic building block, a container is a box model that can contain other widgets, allowing you to customize its dimensions, padding, and decoration.

Row and Column: These widgets help organize children widgets horizontally (Row) or vertically (Column), facilitating the creation of flexible and responsive layouts.

AppBar: AppBar is a material design widget providing a top app bar that typically includes the app's title, leading and trailing icons, and actions.

ListView: Used to create scrollable lists of widgets, ListView is versatile for displaying a large number of items efficiently.

TextField: Enables users to input text, providing a text editing interface with options for validation, styling, and interaction.

ElevatedButton is a Flutter widget used to create a button with a raised appearance. It typically represents the primary action in a user interface. The button has a background color, elevation, and responds to user interactions with visual feedback.

Image: The Image widget displays images from various sources, supporting both local and network images.

Scaffold: A top-level container for an app's visual elements, Scaffold provides a structure that includes an AppBar, body, and other optional features like drawers and bottom navigation.

Card: Representing a material design card, this widget displays information in a compact and visually appealing format, often used for grouping related content.

GestureDetector: Allows detection of various gestures like taps, drags, and long presses, enabling interactive responses to user input.

Stack: A widget that allows children widgets to be overlaid, facilitating complex UI designs by layering widgets on top of each other.

FutureBuilder: Ideal for handling asynchronous operations, FutureBuilder simplifies the management of UI updates based on the completion of a Future, making it valuable for fetching and displaying data.

These are just a few of the many widgets available in Flutter, each serving a unique purpose in crafting dynamic and user-friendly interfaces.

```
import 'dart:io';
import 'package:flutter/material.dart';
// import 'package:slicing_snapchat/firebase_options.dart';
// import 'package:slicing_snapchat/page/home_page.dart';
// import 'package:slicing_snapchat/page/initial_page.dart';
// import 'package:slicing_snapchat/page/login_page.dart';
// import 'package:slicing_snapchat/page/register_page.dart';

import 'package:firebase_core/firebase_core.dart';
import 'package:snapchatfinal/firebase_options.dart';
import 'package:snapchatfinal/page/home_page.dart';
import 'package:snapchatfinal/page/initial_page.dart';
import 'package:snapchatfinal/page/login_page.dart';
import 'package:snapchatfinal/page/register_page.dart';
// import 'package:get/get.dart';

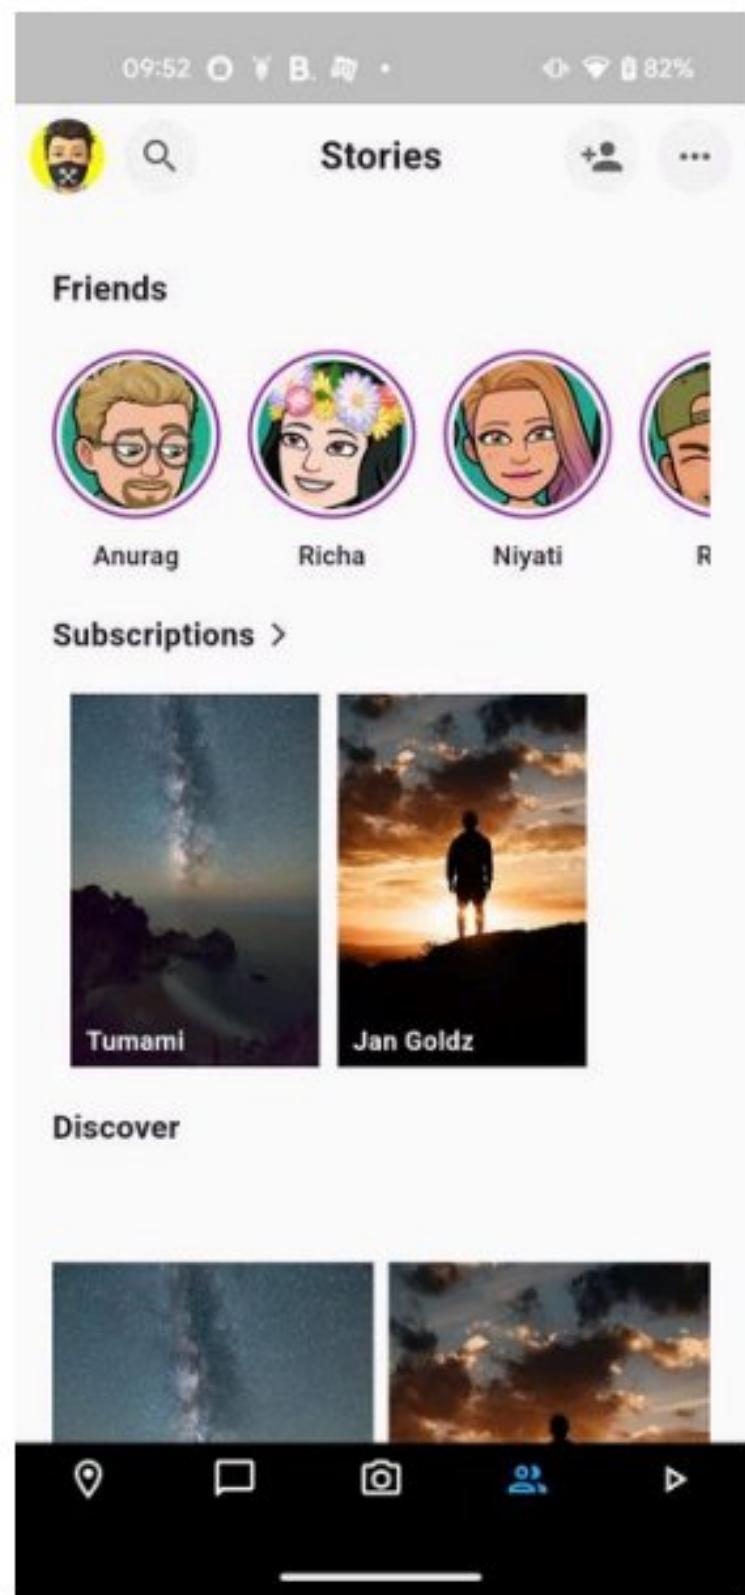

void main() async{
  WidgetsFlutterBinding.ensureInitialized();
  await Firebase.initializeApp(
    options: DefaultFirebaseOptions.currentPlatform);

  runApp(MyApp());
}

class MyApp extends StatelessWidget {
  @override
  Widget build(BuildContext context) {
    return MaterialApp(
      debugShowCheckedModeBanner: false,
      theme: ThemeData(
        primaryColor: Color(0xFF838486),
      ),
      initialRoute: '/',
      routes: {
        '/': (context) => InitialPage(),
      }
    );
}
```

```
'/login_page': (context) => LoginPage(),  
'/register_page': (context) => RegisterPage(),  
'/home_page': (context) => HomePage(),  
},  
);  
}  
}
```

App UI:

Widgets used: Icons, font, bottom navigation bar, image

Conclusion: Thus, understood the use of basic common widgets used in Mobile App Development and used some of them to create the login page for the chosen mini project application.

MAD & PWA Lab Journal

Experiment No.	03
Experiment Title.	To include icons, images, fonts in Flutter app
Roll No.	26
Name	Khushi Jeswani
Class	D15A
Subject	MAD & PWA Lab
Lab Outcome	LO2: Design and Develop interactive Flutter App by using widgets, layouts, gestures and animation
Grade:	10

Experiment 3

Name: Khushi Jeswani

Div: D15A

Roll no: 26

Aim: To include icons, images, fonts in Flutter app Theory:

Text Widget:

- The Text widget is used to display textual content within a Flutter application.
- It allows you to customize the appearance of text, including font family, size, weight, style, color, alignment, and more.
- Text widgets support both single-line and multi-line text.
- You can use Text widgets within various Flutter layout widgets such as Column, Row, ListView, etc., to display text in different parts of the screen.
- Text widgets can also be styled dynamically using theming or state management techniques.

Button Widget:

- Flutter provides several types of buttons, including ElevatedButton, TextButton, OutlinedButton, and IconButton.
- Buttons are interactive elements that users can tap or click to trigger actions or events in the application.
- Each type of button has its own style and appearance, but they all support customization of properties such as text, color, padding, shape, and onPressed callback.
- Buttons can be placed within Flutter layout widgets like Row, Column, Container, etc., to create interactive user interfaces.
- Flutter buttons can also be disabled or enabled based on certain conditions, and their appearance can be adjusted accordingly.

Image Widget:

- The Image widget is used to display images within a Flutter application.
- It supports various image formats such as JPEG, PNG, GIF, WebP, and SVG (using the flutter_svg package).
- Images can be loaded from different sources including local assets, network URLs, memory, and file paths.
- The Image widget provides properties to control the image's size, alignment, fit, repeat mode, color filters, and more.
- Flutter also provides advanced features for image caching, resizing, and processing to optimize performance and memory usage.
- Images are often used to enhance the visual appeal of an application and to convey information to the user through graphics and icons.

Code:

```
import 'package:flutter/material.dart';
import 'package:snapchatfinal/page/chat_screen.dart';
import 'reels_page.dart';
import 'stories_page.dart';
import 'caemra_page.dart';
import 'chat_page.dart';
import 'initial_page.dart';
import 'location_page.dart';

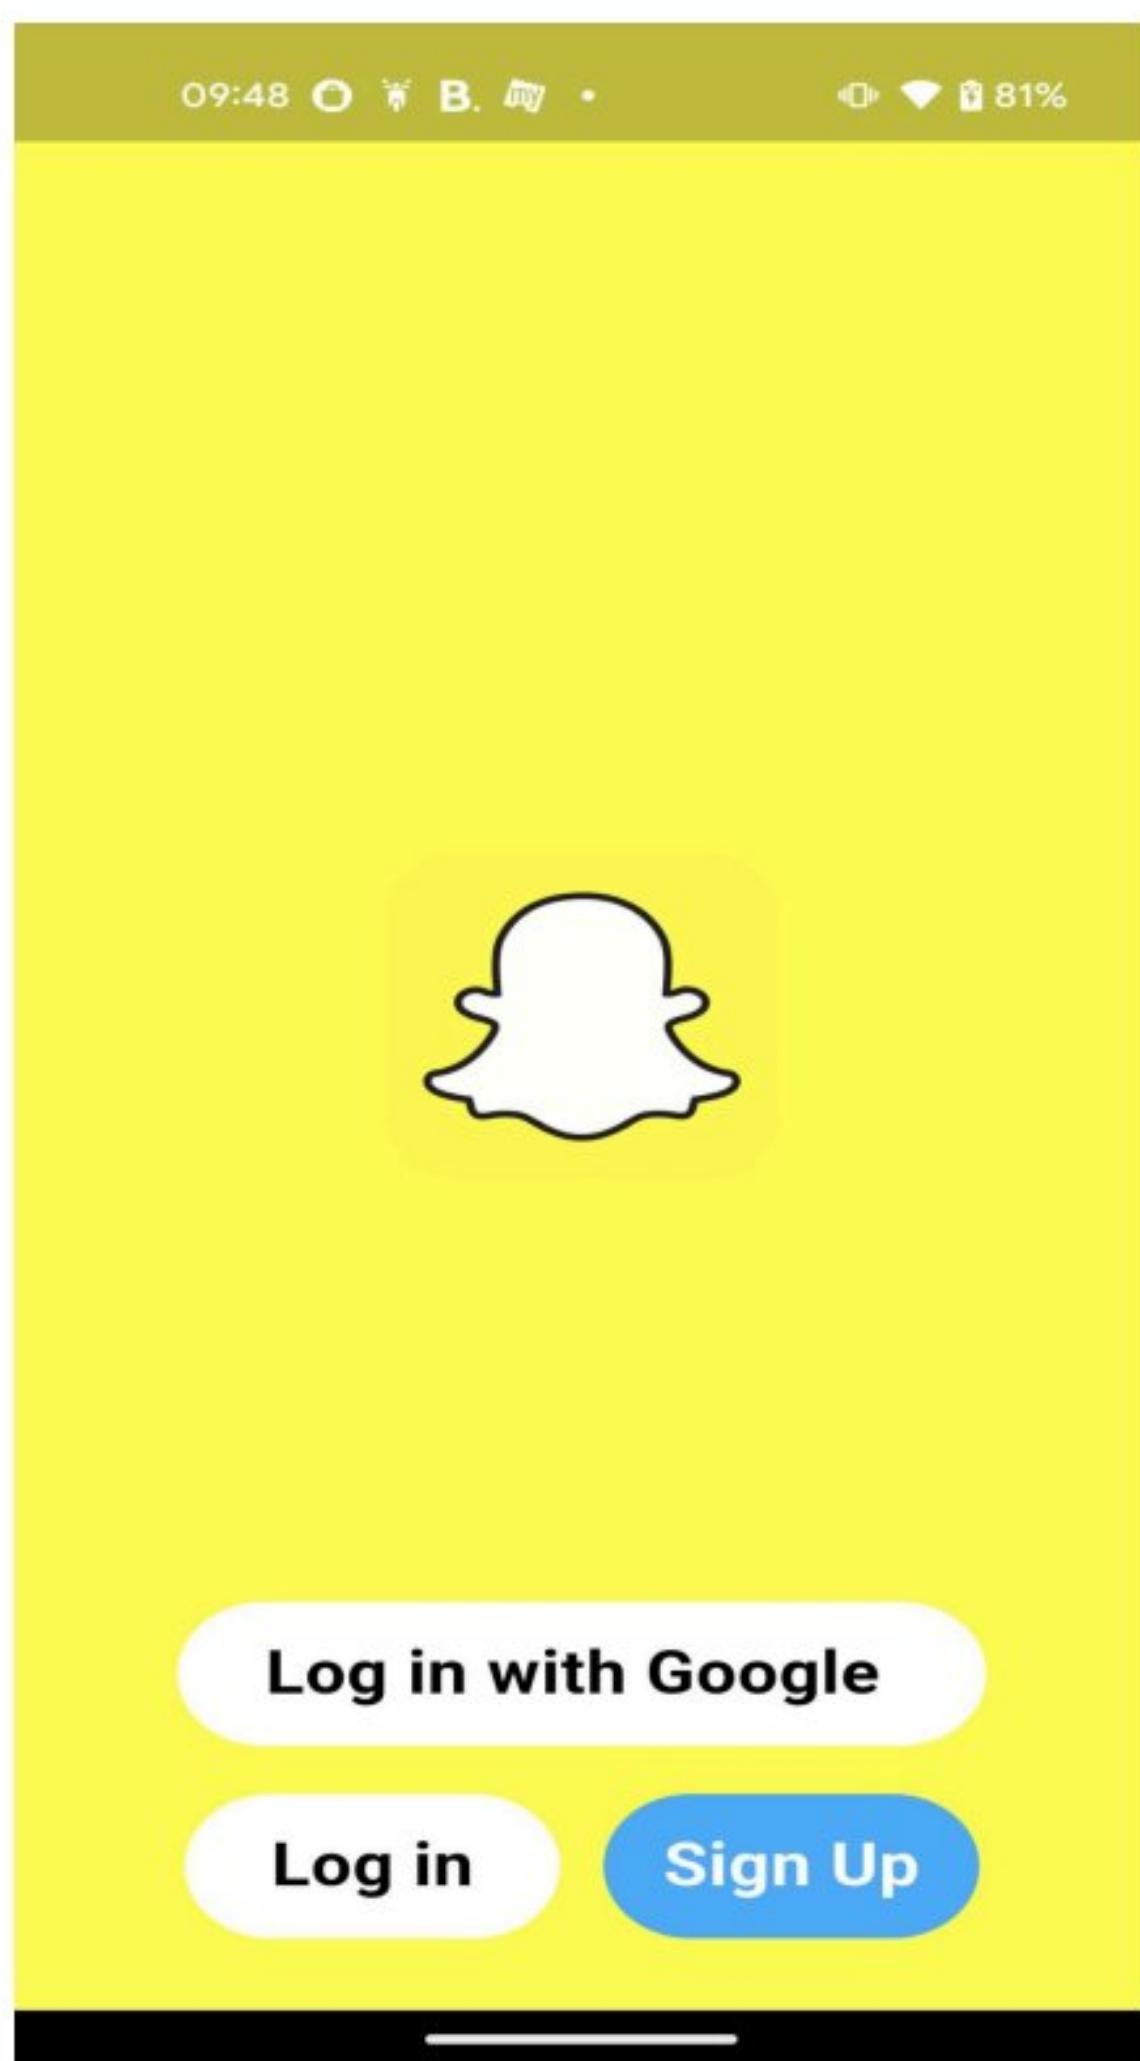

class HomePage extends StatefulWidget {
    @override
    State<HomePage> createState() => _HomePageState();
}

class _HomePageState extends State<HomePage> {
    int _selectedIndex = 0;
    static const List<Widget> _widgetOptions = <Widget>[
        LocationPage(),
        ChatPage(),
        CameraPage(),
        StoriesPage(),
        ReelPage(),
    ];
    void _onItemTapped(int index) {
        setState(() {
            _selectedIndex = index;
            if(index == 1){ // Check if the chat icon is tapped
                Navigator.push(
                    context,
                    MaterialPageRoute(builder: (context) => ChatPage2()), // Navigate to ChatScreen
                );
            }
        });
    }
    @override
    Widget build(BuildContext context) {
        return Scaffold(
            backgroundColor: Colors.white,
            body: SafeArea(child: _widgetOptions[_selectedIndex]),
            bottomNavigationBar: BottomNavigationBar(
                items: <BottomNavigationBarItem>[
```

```
BottomNavigationBarItem(  
    backgroundColor: Colors.black,  
    icon: Icon(  
        Icons.location_on_outlined,  
        size: 25.0,  
        color: Colors.white,  
    ),  
    label: "",  
,  
BottomNavigationBarItem(  
    backgroundColor: Colors.black,  
    icon: Icon(  
        Icons.chat_bubble_outline_rounded,  
        size: 25.0,  
        color: Colors.white,  
    ),  
    label: "",  
,  
BottomNavigationBarItem(  
    backgroundColor: Colors.black,  
    icon: Icon(  
        Icons.camera_alt_outlined,  
        size: 25.0,  
        color: Colors.white,  
    ),  
    label: "",  
,  
BottomNavigationBarItem(  
    backgroundColor: Colors.black,  
    icon: Icon(  
        Icons.group_outlined,  
        size: 25.0,  
        color: Color(0xFF10ACFF),  
    ),  
    label: "",  
,  
BottomNavigationBarItem(  
    backgroundColor: Colors.black,  
    icon: Icon(  
        Icons.play_arrow_outlined,  
        size: 25.0,  
        color: Colors.white,  
    ),  
    label: "",
```

```
        ),  
    ],  
    type: BottomNavigationBarType.fixed,  
    currentIndex: _selectedIndex,  
    selectedItemColor: Color(0xFF10ACFF),  
    backgroundColor: Colors.black,  
    onTap: _onItemTapped,  
    unselectedItemColor: Colors.white,  
),  
);  
}  
}  
}
```

App UI:

Widgets used: Image, Text, Icons,

Conclusion: Thus, understood the use of Icons, images and font widgets in Flutter. Implemented Icons, Images and fonts in my Flutter application.

MAD & PWA Lab Journal

Experiment No.	04
Experiment Title.	To create an interactive Form using form widget
Roll No.	26
Name	Sonali Makhijani
Class	D15A
Subject	MAD & PWA Lab
Lab Outcome	LO2: Design and Develop interactive Flutter App by using widgets, layouts, gestures and animation
Grade:	10

Experiment 4

Name: Khushi Jeswani

Div: D15A

Roll no: 26

Aim: To create an interactive form using the form widget Theory:

- **Form Widget:**
 - The Form widget is a container used to group multiple form fields together.
 - It helps manage the state of the form, including validation, submission, and resetting.
 - The Form widget maintains a FormState object that holds the current state of the form fields.
 - Form widgets facilitate form submission, validation, and error handling.
- **FormField Widget:**
 - A TextFormField widget represents a single form field within a Form.
 - Flutter provides various subclasses of the TextFormField widget for different types of input fields, such as TextFormField, CheckboxFormField, RadioFormField, DropdownButtonFormField, etc.
 - Each form field widget encapsulates the logic for validating user input and managing its state.
 - Form fields can be customized with properties to specify validation rules, error messages, initial values, input formatting, and more.
 - Form fields automatically register themselves with the Form widget and handle validation and state management transparently.
- **Validation:**
 - Flutter's form widgets include built-in support for validation to ensure that user input meets specific criteria.
 - Form fields can be configured with validation functions or validators to check the correctness of user input.
 - Validators can be synchronous or asynchronous functions that return error messages if the input is invalid.
 - Flutter provides a FormFieldState class associated with each form field, which exposes methods to validate the field's value and retrieve validation errors if any.
- **Submission:**
 - The Form widget provides a mechanism to submit the form data once it's been filled out by the user.
 - Developers can define an onSaved callback for each form field to specify how the field's value should be processed when the form is submitted.

- When the form is submitted, the `onSaved` callbacks for all form fields are invoked, allowing developers to collect, process, and submit the form data to a backend server or perform other actions.

Widgets used: Form Widget, Form Widget Fields

Conclusion: Therefore understood the use of form widget in Flutter. Implemented signup and login page using form widget in my Flutter application.

MAD & PWA Lab Journal

Experiment No.	05
Experiment Title.	To apply navigation, routing and gestures in Flutter App
Roll No.	26
Name	Sonali Makhijani
Class	D15A
Subject	MAD & PWA Lab
Lab Outcome	LO2: Design and Develop interactive Flutter App by using widgets, layouts, gestures and animation
Grade:	10

Experiment 5

Name: Khsuhi Jeswani

Div: D15A

Roll no: 63

Aim: To apply navigation, routing and gestures in Flutter App Theory:

Navigation:

- Navigation refers to the process of moving between different screens or pages within a Flutter app.
- In Flutter, navigation is typically managed using the Navigator class, which maintains a stack of routes.
- Each route represents a screen or page in the app, and the navigator manages the navigation stack, allowing users to move forward and backward between routes.
- Navigation can be triggered by user actions such as tapping buttons, selecting items from lists, or swiping between pages.

Routing:

- Routing is the mechanism used to define and manage the routes within a Flutter app.
- Routes are defined using route names and associated with corresponding widgets or screens.
- Flutter provides several routing mechanisms, including named routes, on-the-fly routes, and nested routes.
- Named routes allow developers to define routes with unique names and navigate to them using the Navigator based on these names.
- On-the-fly routes are created dynamically at runtime and pushed onto the navigation stack as needed.
- Nested routes involve embedding navigators within other navigators to create complex navigation structures, such as tab-based navigation or drawer navigation.

Gestures:

- Gestures refer to user interactions such as tapping, dragging, swiping, pinching, and rotating on the screen.
- Flutter provides a rich set of gesture recognition widgets and APIs to handle user gestures effectively.
- Common gesture recognition widgets include GestureDetector, InkWell, InkyResponse, Draggable, Dismissible, etc.
- These widgets allow developers to detect various user gestures and trigger corresponding actions or animations in response.
- Gestures can be used to implement interactive UI elements, such as buttons, sliders, swipers, drag-and-drop interfaces, and more.

Gesture Detection:

- Gesture detection in Flutter involves registering gesture recognizers on widgets to detect

specific user interactions.

- Gesture recognizers analyze touch input and determine whether a specific gesture has occurred, such as a tap, double-tap, long-press, drag, etc.
- Once a gesture is detected, Flutter invokes the corresponding callback function associated with the gesture recognizer.
- Developers can customize gesture detection by configuring properties such as gesture sensitivity, velocity thresholds, and touch area boundaries.

Gesture Handling:

- After a gesture is detected, developers can handle it by performing various actions, such as updating UI state, navigating between screens, triggering animations, or executing business logic.
- Gesture handling involves responding to user interactions in a way that provides feedback and enhances the user experience.
- Flutter's declarative programming model makes it easy to update UI elements in response to user gestures, ensuring a smooth and responsive user interface.

```

App UI:

Widgets used: Images, Text, Bottom nav bar, Icons

Search page Upload page

Widgets used: Images, Text, Bottom nav bar, Icons, Bottom sheet, Text field

Conclusion: Therefore understood navigation, routing, gesture detection and gesture handling in Flutter and implemented the same in my Flutter application to route different pages.

Conclusion: Therefore understood navigation, routing, gesture detection and gesture handling in Flutter and implemented the same in my Flutter application to route different pages.

MAD & PWA Lab Journal

Experiment No.	06
Experiment Title.	To Connect Flutter UI with fireBase database
Roll No.	26
Name	Khushi Jeswani
Class	D15A/D15B
Subject	MAD & PWA Lab
Lab Outcome	LO3: Analyze and Build production ready Flutter App by incorporating backend services and deploying on Android / iOS
Grade:	10

Name: Khushi Jeswani

Division: D15A

Roll No: 26

Batch: B

Experiment No 6

Aim: To Connect Flutter UI with Firebase

Theory:

FlutterFire is a set of Flutter plugins that enable Flutter developers to integrate their applications with various Firebase services. Firebase is a comprehensive mobile and web application development platform provided by Google. FlutterFire is specifically designed to provide Flutter developers with a seamless way to interact with Firebase services.

Key features of FlutterFire include:

1. Firebase Authentication: FlutterFire provides plugins to easily integrate Firebase Authentication, allowing developers to implement user sign-up, sign-in, and password recovery features in their Flutter applications. Firebase supports various authentication methods, including email/password, Google Sign-In, Facebook Sign-In, and more.
2. Cloud Firestore and Realtime Database: FlutterFire supports both Cloud Firestore and Firebase Realtime Database, enabling developers to store and retrieve data in real-time. Firestore is a NoSQL document database, while Realtime Database is a JSON-based Database.
3. Cloud Functions: Developers can deploy serverless functions using Cloud Functions for Firebase, and FlutterFire allows Flutter apps to trigger and interact with these functions.
4. Cloud Storage: FlutterFire supports Firebase Cloud Storage, allowing developers to upload, download, and manage files in the cloud. This is useful for handling user-generated content, such as images or videos.
5. Firebase Cloud Messaging (FCM): FCM enables developers to send push notifications to their Flutter applications. FlutterFire provides plugins for integrating FCM and handling push notifications.
6. Firebase Performance Monitoring: Developers can monitor the performance of their Flutter applications using Firebase Performance Monitoring. This includes measuring app startup time, screen rendering, and network performance.
7. Firebase Analytics: FlutterFire includes plugins for integrating Firebase Analytics, enabling developers to gain insights into user behavior and app usage.

8. Firebase Remote Config: FlutterFire supports Firebase Remote Config, allowing developers to remotely configure app behavior without publishing updates. This is useful for A/B testing and feature toggling.

9. Firebase Crashlytics: FlutterFire includes support for Firebase Crashlytics, providing real-time crash reporting to help developers identify and fix issues quickly.

10. Firebase AdMob: FlutterFire includes AdMob plugins for integrating advertisements into Flutter applications using Firebase AdMob.

Code:

```
// File generated by FlutterFire CLI.  
// ignore_for_file: lines_longer_than_80_chars, avoid_classes_with_only_static_members  
import 'package:firebase_core/firebase_core.dart' show FirebaseOptions;  
import 'package:flutter/foundation.dart'  
    show defaultTargetPlatform, kIsWeb, TargetPlatform;  
  
/// Default [FirebaseOptions] for use with your Firebase apps.  
///  
/// Example:  
/// dart  
/// import 'firebase_options.dart';  
/// // ...  
/// await Firebase.initializeApp(  
///   options: DefaultFirebaseOptions.currentPlatform,  
/// );  
///  
class DefaultFirebaseOptions {

Firebase screenshots:

The screenshot shows the Firebase Authentication console with a dark theme. The top navigation bar includes tabs for 'Users', 'Sign-in method', 'Templates', 'Usage', 'Settings', and 'Extensions'. A search bar at the top allows searching by email address, phone number, or user UID. Below the search bar is a button labeled 'Add user' and a refresh/copy icon. The main area displays a table of user data with columns: Identifier, Providers, Created, Signed In, and User UID. The data shows seven users registered between March 6 and 20, 2024, using Google and Email providers. The User UIDs are also listed.

Identifier	Providers	Created	Signed In	User UID

PWA EXPERIMENT 7

Aim:- To write meta data of your Ecommerce PWA in a Web app manifest file to enable “add to homescreen feature”.

Theory:-

Regular Web App A regular web app is a website that is designed to be accessible on all mobile devices such that the content gets fit as per the device screen. It is designed using a web technology stack (HTML, CSS, JavaScript, Ruby, etc.) and operates via a browser. They offer various native-device features and functionalities. However, it entirely depends on the browser the user is using. In other words, it might be possible that you can access a native-device feature on Chrome but not on Safari or Mozilla Firefox because the browsers are incompatible with that feature.

Progressive Web App Progressive Web App (PWA) is a regular web app, but some extras enable it to deliver an excellent user experience. It is a perfect blend of desktop and mobile application experience to give both platforms to the end-users.

Difference between PWAs vs. Regular Web Apps:

A Progressive Web is different and better than a Regular Web app with features like:

1. Native Experience Though a PWA runs on web technologies (HTML, CSS, JavaScript) like a Regular web app, it gives user experience like a native mobile application. It can use most native device features, including push notifications, without relying on the browser or any other entity. It offers a seamless and integrated user experience that it is quite tough for one to differentiate between a PWA and a Native application by considering its look and feel.
2. Ease of Access Unlike other mobile apps, PWAs do not demand longer download time and make memory space available for installing the applications. The PWAs can be shared and installed by a link, which cuts down the number of steps to install and use. These applications can easily keep an app icon on the user's home screen, making the app easily accessible to the users and helps the brands remain in the users' minds, and improving the chances of interaction.
3. Faster Services PWAs can cache the data and serve the user with text stylesheets, images, and other web content even before the page loads completely. This lowers the waiting

time for the end-users and helps the brands improve the user engagement and retention rate, which eventually adds value to their business.

4. Engaging Approach As already shared, the PWAs can employ push notifications and other native device features more efficiently. Their interaction does not depend on the browser user uses. This eventually improves the chances of notifying the user regarding your services, offers, and other options related to your brand and keeping them hooked to your brand. In simpler words, PWAs let you maintain the user engagement and retention rate.
5. Updated Real-Time Data Access Another plus point of PWAs is that these apps get updated on their own. They do not demand the end-users to go to the App Store or other such platforms to download the update and wait until installed. In this app type, the web app developers can push the live update from the server, which reaches the apps residing on the user's devices automatically. Therefore, it is easier for the mobile app developer to provide the best of the updated functionalities and services to the end-users without forcing them to update their app.
6. Discoverable PWAs reside in web browsers. This implies higher chances of optimizing them as per the Search Engine Optimization (SEO) criteria and improving the Google rankings like that in websites and other web apps.
7. Lower Development Cost Progressive web apps can be installed on the user device like a native device, but it does not demand submission on an App Store. This makes it far more cost-effective than native mobile applications while offering the same set of functionalities.

Pros and cons of the Progressive Web App The main features are:

Progressive — They work for every user, regardless of the browser chosen because they are built at the base with progressive improvement principles.

Responsive — They adapt to the various screen sizes: desktop, mobile, tablet, or dimensions that can later become available.

App-like — They behave with the user as if they were native apps, in terms of interaction and navigation.

Updated — Information is always up-to-date thanks to the data update process offered by service workers

Secure — Exposed over HTTPS protocol to prevent the connection from displaying information or altering the contents.

Searchable — They are identified as “applications” and are indexed by search engines.

Reactivable — Make it easy to reactivate the application thanks to capabilities such as web notifications.

Installable — They allow the user to “save” the apps that he considers most useful with the corresponding icon on the screen of his mobile terminal (home screen) without having to face all the steps and problems related to the use of the app store.

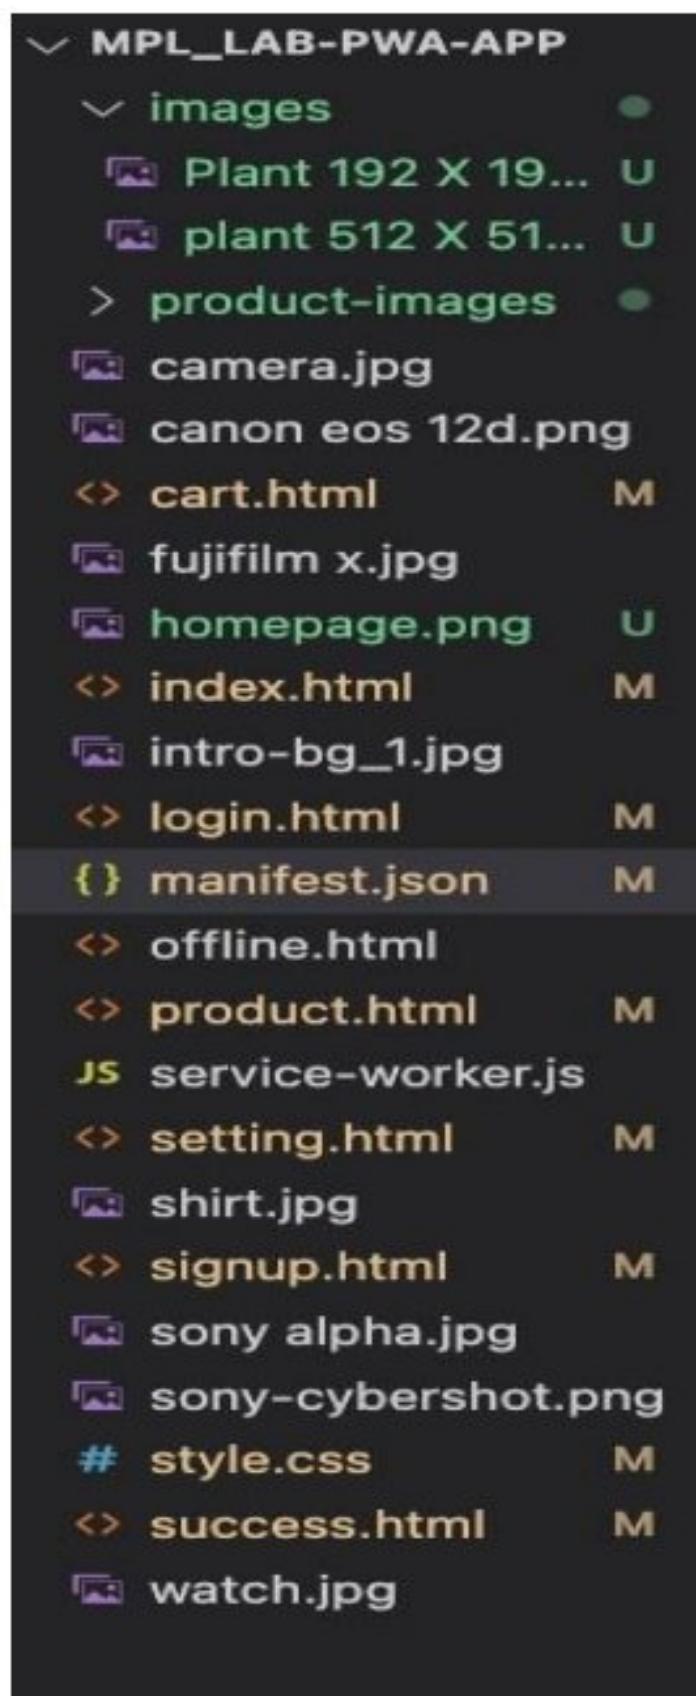

Linkable — Easily shared via URL without complex installations.

Offline — Once more it is about putting the user before everything, avoiding the usual error message in case of weak or no connection

. The PWA are based on two particularities: first of all the ‘skeleton’ of the app, which recalls the page structure, even if its contents do not respond and its elements include the header, the page layout, as well as an illustration that signals that the page is loading.

Weaknesses refer to: iOS support from version 11.3 onwards; Greater use of the device battery; Not all devices support the full range of PWA features (same speech for iOS and Android operating systems); It is not possible to establish a strong re-engagement for iOS users (URL scheme, standard web notifications); Support for offline execution is however limited; Lack of presence on the stores (there is no possibility to acquire traffic from that channel); There is no “body” of control (like the stores) and an approval process; Limited access to some hardware components of the devices; Little flexibility regarding “special” content for users (eg loyalty programs, loyalty, etc.).

};

var returnFromCache = function (request) {
    return caches.open("offline").then(function (cache) {
        return cache.match(request).then(function (matching) {
            if (!matching || matching.status == 404) {
                return cache.match("offline.html");
            } else {
                return matching;
            }
        });
    });
};

var addToCache = function (request) {
    return caches.open("offline").then(function (cache) {
        return fetch(request).then(function (response) {
            return cache.put(request, response.clone()).then(function () {
                return response;
            });
        });
    });
};

RollNo:26

Batch: B

Experiment No 8

Aim: To code and register a service worker, and complete the install and activation process for a new service worker for the E-commerce PWA.

Service Worker

Service Worker is a script that works on browser background without user interaction independently. Also, It resembles a proxy that works on the user side. With this script, you can track network traffic of the page, manage push notifications and develop “offline first” web applications with Cache API.

Things to note about Service Worker:

- A service worker is a programmable network proxy that lets you control how network requests from your page are handled.
- Service workers only run over HTTPS. Because service workers can intercept network requests and modify responses, "man-in-the-middle" attacks could be very bad.
- The service worker becomes idle when not in use and restarts when it's next needed. You cannot rely on a global state persisting between events. If there is information that you need to persist and reuse across restarts, you can use IndexedDB databases.

What can we do with Service Workers?

- You can dominate **Network Traffic**

You can manage all network traffic of the page and do any manipulations. For example, when the page requests a CSS file, you can send plain text as a response or when the page requests an HTML file, you can send a png file as a response. You can also send a true response too.

- You can **Cache**

You can cache any request/response pair with Service Worker and Cache API and you can access these offline content anytime.

- You can manage **Push Notifications**

You can manage push notifications with Service Worker and show any information message to the user.

- You can **Continue**

Although Internet connection is broken, you can start any process with Background Sync of Service Worker.

What can't we do with Service Workers?

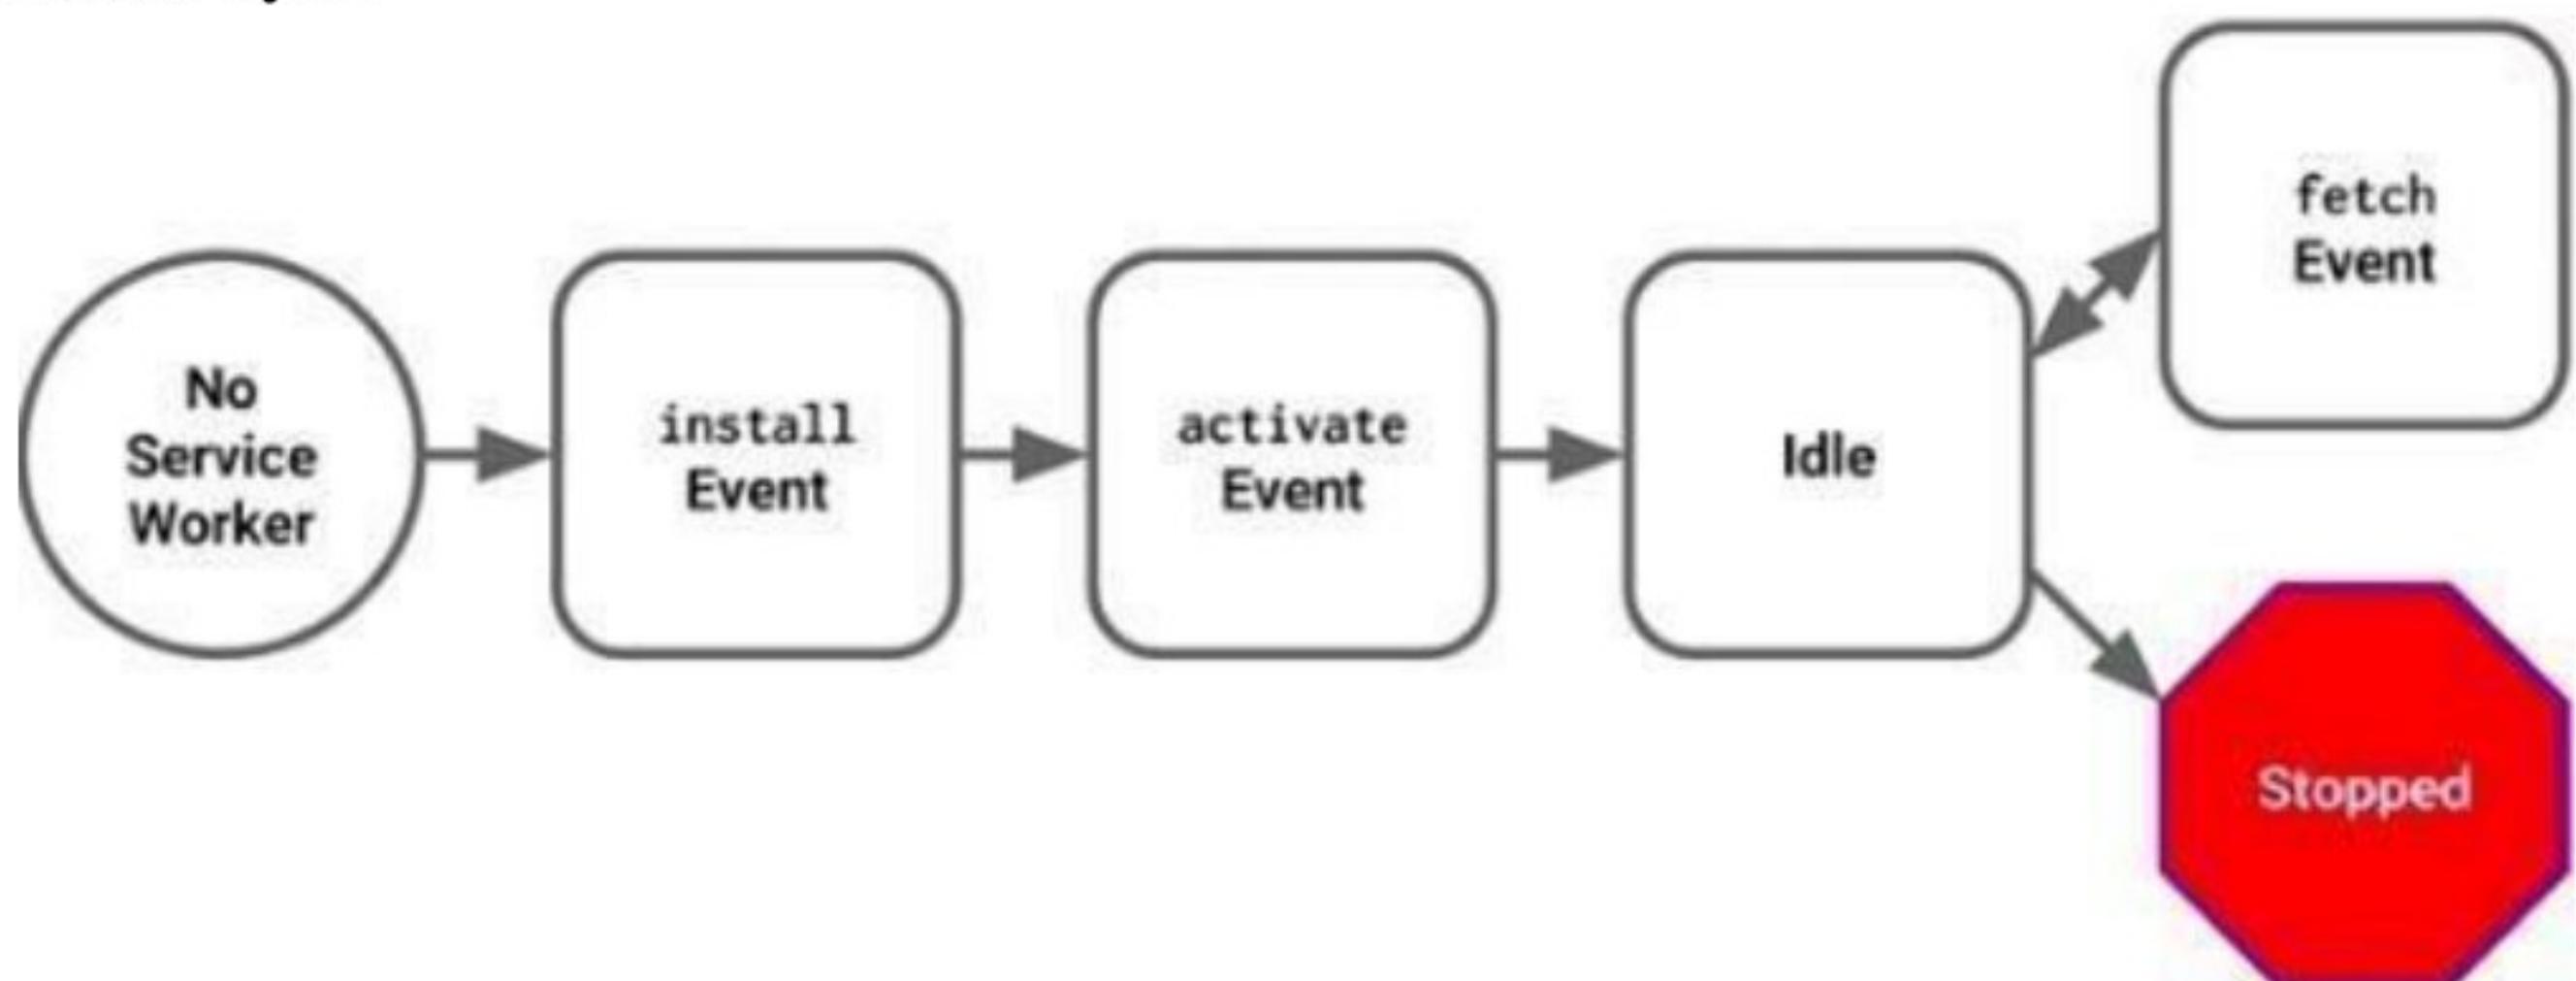

- You can't access the **Window**

You can't access the window, therefore, You can't manipulate DOM elements. But, you can communicate to the window through post Message and manage processes that you want.

- You can't work it on **80 Port**

Service Worker just can work on HTTPS protocol. But you can work on localhost during development.

Service Worker Cycle

A service worker goes through three steps in its life cycle:

- Registration
- Installation
- Activation

Registration

To install a service worker, you need to register it in your main JavaScript code. Registration tells the browser where your service worker is located, and to start installing it in the background. Let's look at an example

main.js

```

if ('serviceWorker' in navigator) {
  navigator.serviceWorker.register('/service-worker.js')
    .then(function(registration) { console.log('Registration successful,
      scope is:', registration.scope);
  })
  .catch(function(error) { console.log('Service worker
    registration failed, error:', error); });
}

```

This code starts by checking for browser support by examining **navigator.serviceWorker**. The service worker is then registered with `navigator.serviceWorker.register`, which returns a promise that resolves when the service worker has been successfully registered. The scope of the service worker is then logged with `registration.scope`. If the service worker is already installed, `navigator.serviceWorker.register` returns the registration object of the currently active service worker.

The scope of the service worker determines which files the service worker controls, in other words, from which path the service worker will intercept requests. The default scope is the location of the service worker file, and extends to all directories below. So if `service-worker.js` is located in the root directory, the service worker will control requests from all files at this domain.

You can also set an arbitrary scope by passing in an additional parameter when registering. For example: `main.js`

```

navigator.serviceWorker.register('/service-worker.js', {
  scope: '/app/'
});

```

In this case we are setting the scope of the service worker to `/app/`, which means the service worker will control requests from pages like `/app/`, `/app/lower/` and `/app/lower/lower`, but not from pages like `/app` or `/`, which are higher.

If you want the service worker to control higher pages e.g. `/app` (without the trailing slash) you can indeed change the scope option, but you'll also need to set the Service-Worker-Allowed HTTP Header in your server config for the request serving the service worker script.

`main.js`

```

navigator.serviceWorker.register('/app/service-worker.js', {
  scope: '/app'
});

```

Installation

Once the browser registers a service worker, installation can be attempted. This occurs if the service worker is considered to be new by the browser, either because the site currently doesn't have a registered service worker, or because there is a byte difference between the new service worker and the previously installed one.

A service worker installation triggers an install event in the installing service worker. We can include an install event listener in the service worker to perform some task when the service worker installs. For instance, during the install, service workers can precache parts of a web app so that it loads instantly the next time a user opens it (see caching the application shell). So, after that first load, you're going to benefit from instant repeat loads and your time to interactivity is going to be even better in those cases. An example of an installation event listener looks like this: service-worker.js

```
// Listen for install event, set callback
self.addEventListener('install', function(event) {
  // Perform some task
});
```

Activation

Once a service worker has successfully installed, it transitions into the activation stage. If there are any open pages controlled by the previous service worker, the new service worker enters a waiting state. The new service worker only activates when there are no longer any pages loaded that are still using the old service worker. This ensures that only one version of the service worker is running at any given time.

When the new service worker activates, an activate event is triggered in the activating service worker. This event listener is a good place to clean up outdated caches (see the Offline Cookbook for an example).

service-worker.js

```
self.addEventListener('activate', function(event) {
  // Perform some task
});
```

Once activated, the service worker controls all pages that load within its scope, and starts listening for events from those pages. However, pages in your app that were loaded before the service worker activation will not be under service worker control. The new service worker will only take over when you close and reopen your app, or if the service worker calls **clients.claim()**. Until then, requests from this page will not be intercepted by the new service worker. This is intentional as a way to ensure consistency in your site.

Code in service-worker.js

```

self.addEventListener('install', function(event) {
  event.waitUntil(
    caches.open(CACHE_NAME)
      .then(function(cache) {
        console.log('Opened cache');
        return cache.addAll(urlsToCache)
      })
      .catch(function(error) {
        console.error('Cache.addAll error:', error);
      });
  );
});

self.addEventListener('activate', function(event) {
  // Perform activation steps
  event.waitUntil(
    caches.keys().then(function(cacheNames) {
      return Promise.all(
        cacheNames.map(function(cacheName) {
          if (cacheName !== CACHE_NAME) {
            return caches.delete(cacheName);
          }
        })
      );
    })
  );
});

```

Code in index.html

```

<script>
  // Add event listener to execute code when page loads
  window.addEventListener('load', () => {
    // Call registerSW function when page loads
    registerSW();
  });

```

```

// Register the Service Worker

async function registerSW() {
    // Check if browser supports Service Worker
    if ('serviceWorker' in navigator) {
        try {
            // Register the Service Worker named 'serviceworker.js' await
            navigator.serviceWorker.register('service-worker.js');

        }
        catch (e) {
            // Log error message if registration fails
            console.error('ServiceWorker registration failed: ', e);
        }
    }
}

```

Output:

The screenshot shows the Chrome DevTools interface with the "Application" tab selected. The main content area displays a web page for "Purity Plants" featuring several potted plants and a promotional banner. The DevTools sidebar on the right is focused on the "Service workers" section. Key details visible include:

- Service workers:** A single service worker is listed, activated and stopped.
- Manifest:** Associated with the service worker.
- Storage:** Shows various types of storage available, including Local storage, Session storage, IndexedDB, and Cookies.
- Background services:** Lists various background tasks managed by the service worker.
- Periodic Sync:** Shows scheduled sync tasks.
- Update Cycle:** Details the history of updates for the service worker, including Install, Wait, and Activate events.

Conclusion: Hence We Successfully Registered our Service Worker on the Progressive Web App and it is activated as well as running

MAD & PWA Lab Journal

Experiment No.	09
Experiment Title.	To implement Service worker events like fetch, sync and push for E-commerce PWA
Roll No.	26
Name	Khushi Jeswani
Class	D15A
Subject	MAD & PWA Lab
Lab Outcome	LO5: Design and Develop a responsive User Interface by applying PWA Design techniques
Grade:	15

Name: Khushi Jeswani

Division: D15A

Roll No:26

Batch : B

Experiment No 9

Aim: To implement Service worker events like fetch, sync and push for E-commerce PWA.

Theory:

Service Worker

Service Worker is a script that works on browser background without user interaction independently. Also, It resembles a proxy that works on the user side. With this script, you can track network traffic of the page, manage push notifications and develop “offline first” web applications with Cache API.

Things to note about Service Worker:

- A service worker is a programmable network proxy that lets you control how network requests from your page are handled.
- Service workers only run over HTTPS. Because service workers can intercept network requests and modify responses, "man-in-the-middle" attacks could be very bad.
- The service worker becomes idle when not in use and restarts when it's next needed. You cannot rely on a global state persisting between events. If there is information that you need to persist and reuse across restarts, you can use IndexedDB databases.
- Service workers make extensive use of promises, so if you're new to promises, then you should stop reading this and check out Promises, an introduction.

Fetch Event

You can track and manage page network traffic with this event. You can check existing cache, manage “cache first” and “network first” requests and return a response that you want.

Of course, you can use many different methods but you can find in the following example a “cache first” and “network first” approach. In this example, if the request’s and current location’s origin are the same (Static content is requested.), this is called “cacheFirst” but if you request a targeted external URL, this is called “networkFirst”.

- **CacheFirst** - In this function, if the received request has cached before, the cached response is returned to the page. But if not, a new response requested from the network.
- **NetworkFirst** - In this function, firstly we can try getting an updated response from the network, if this process completed successfully, the new response will be cached and returned.

But if this process fails, we check whether the request has been cached before or not. If a cache exists, it is returned to the page, but if not, this is up to you. You can return dummy content or information messages to the page.

```
self.addEventListener("fetch", function (event) {
  const req = event.request;
  const url = new URL(req.url);

  if (url.origin === location.origin) {
    event.respondWith(cacheFirst(req));
  }
  else {
    event.respondWith(networkFirst(req));
  }
});

async function cacheFirst(req) {
  return await caches.match(req) || fetch(req);
}

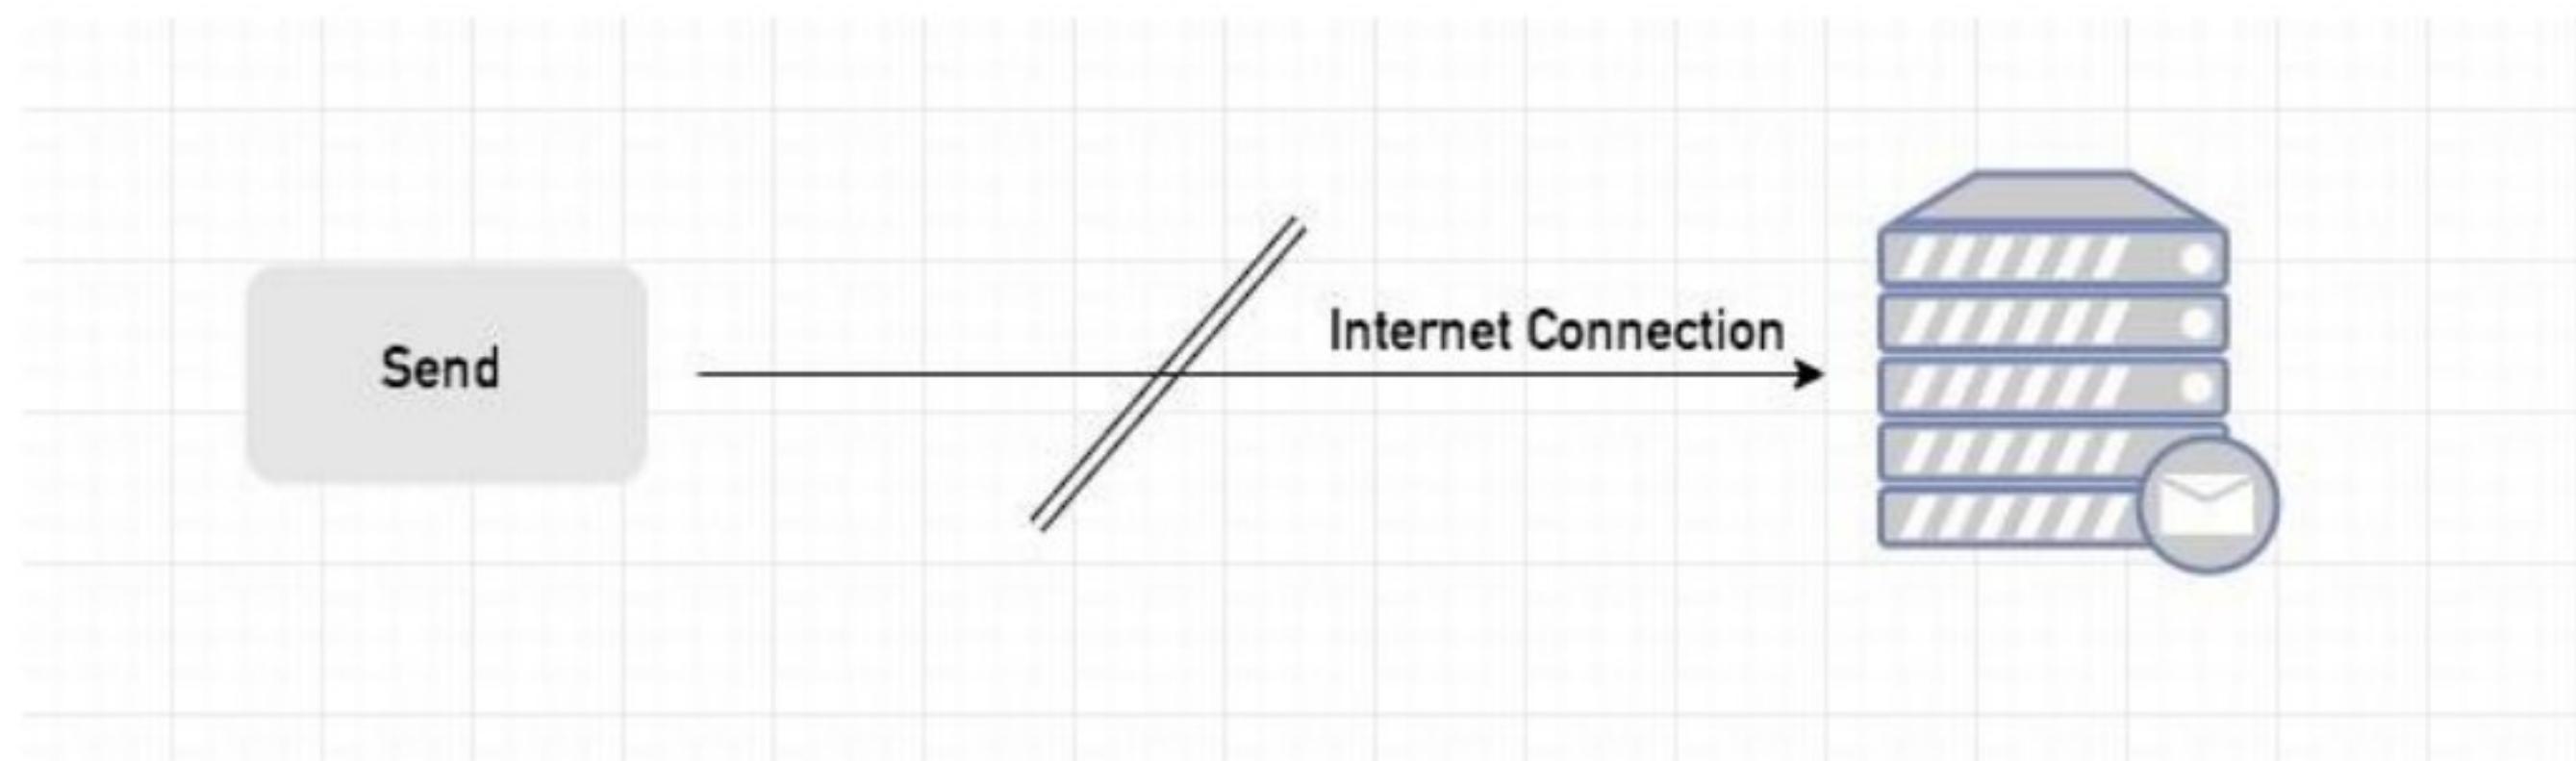

async function networkFirst(req) {
  const cache = await caches.open("pwa-dynamic");
  try {
    const res = await fetch(req);
    cache.put(req, res.clone());
    return res;
  } catch (error) {
    const cachedResponse = await cache.match(req);
    return cachedResponse || await caches.match("./noconnection.json");
  }
}
```

Sync Event

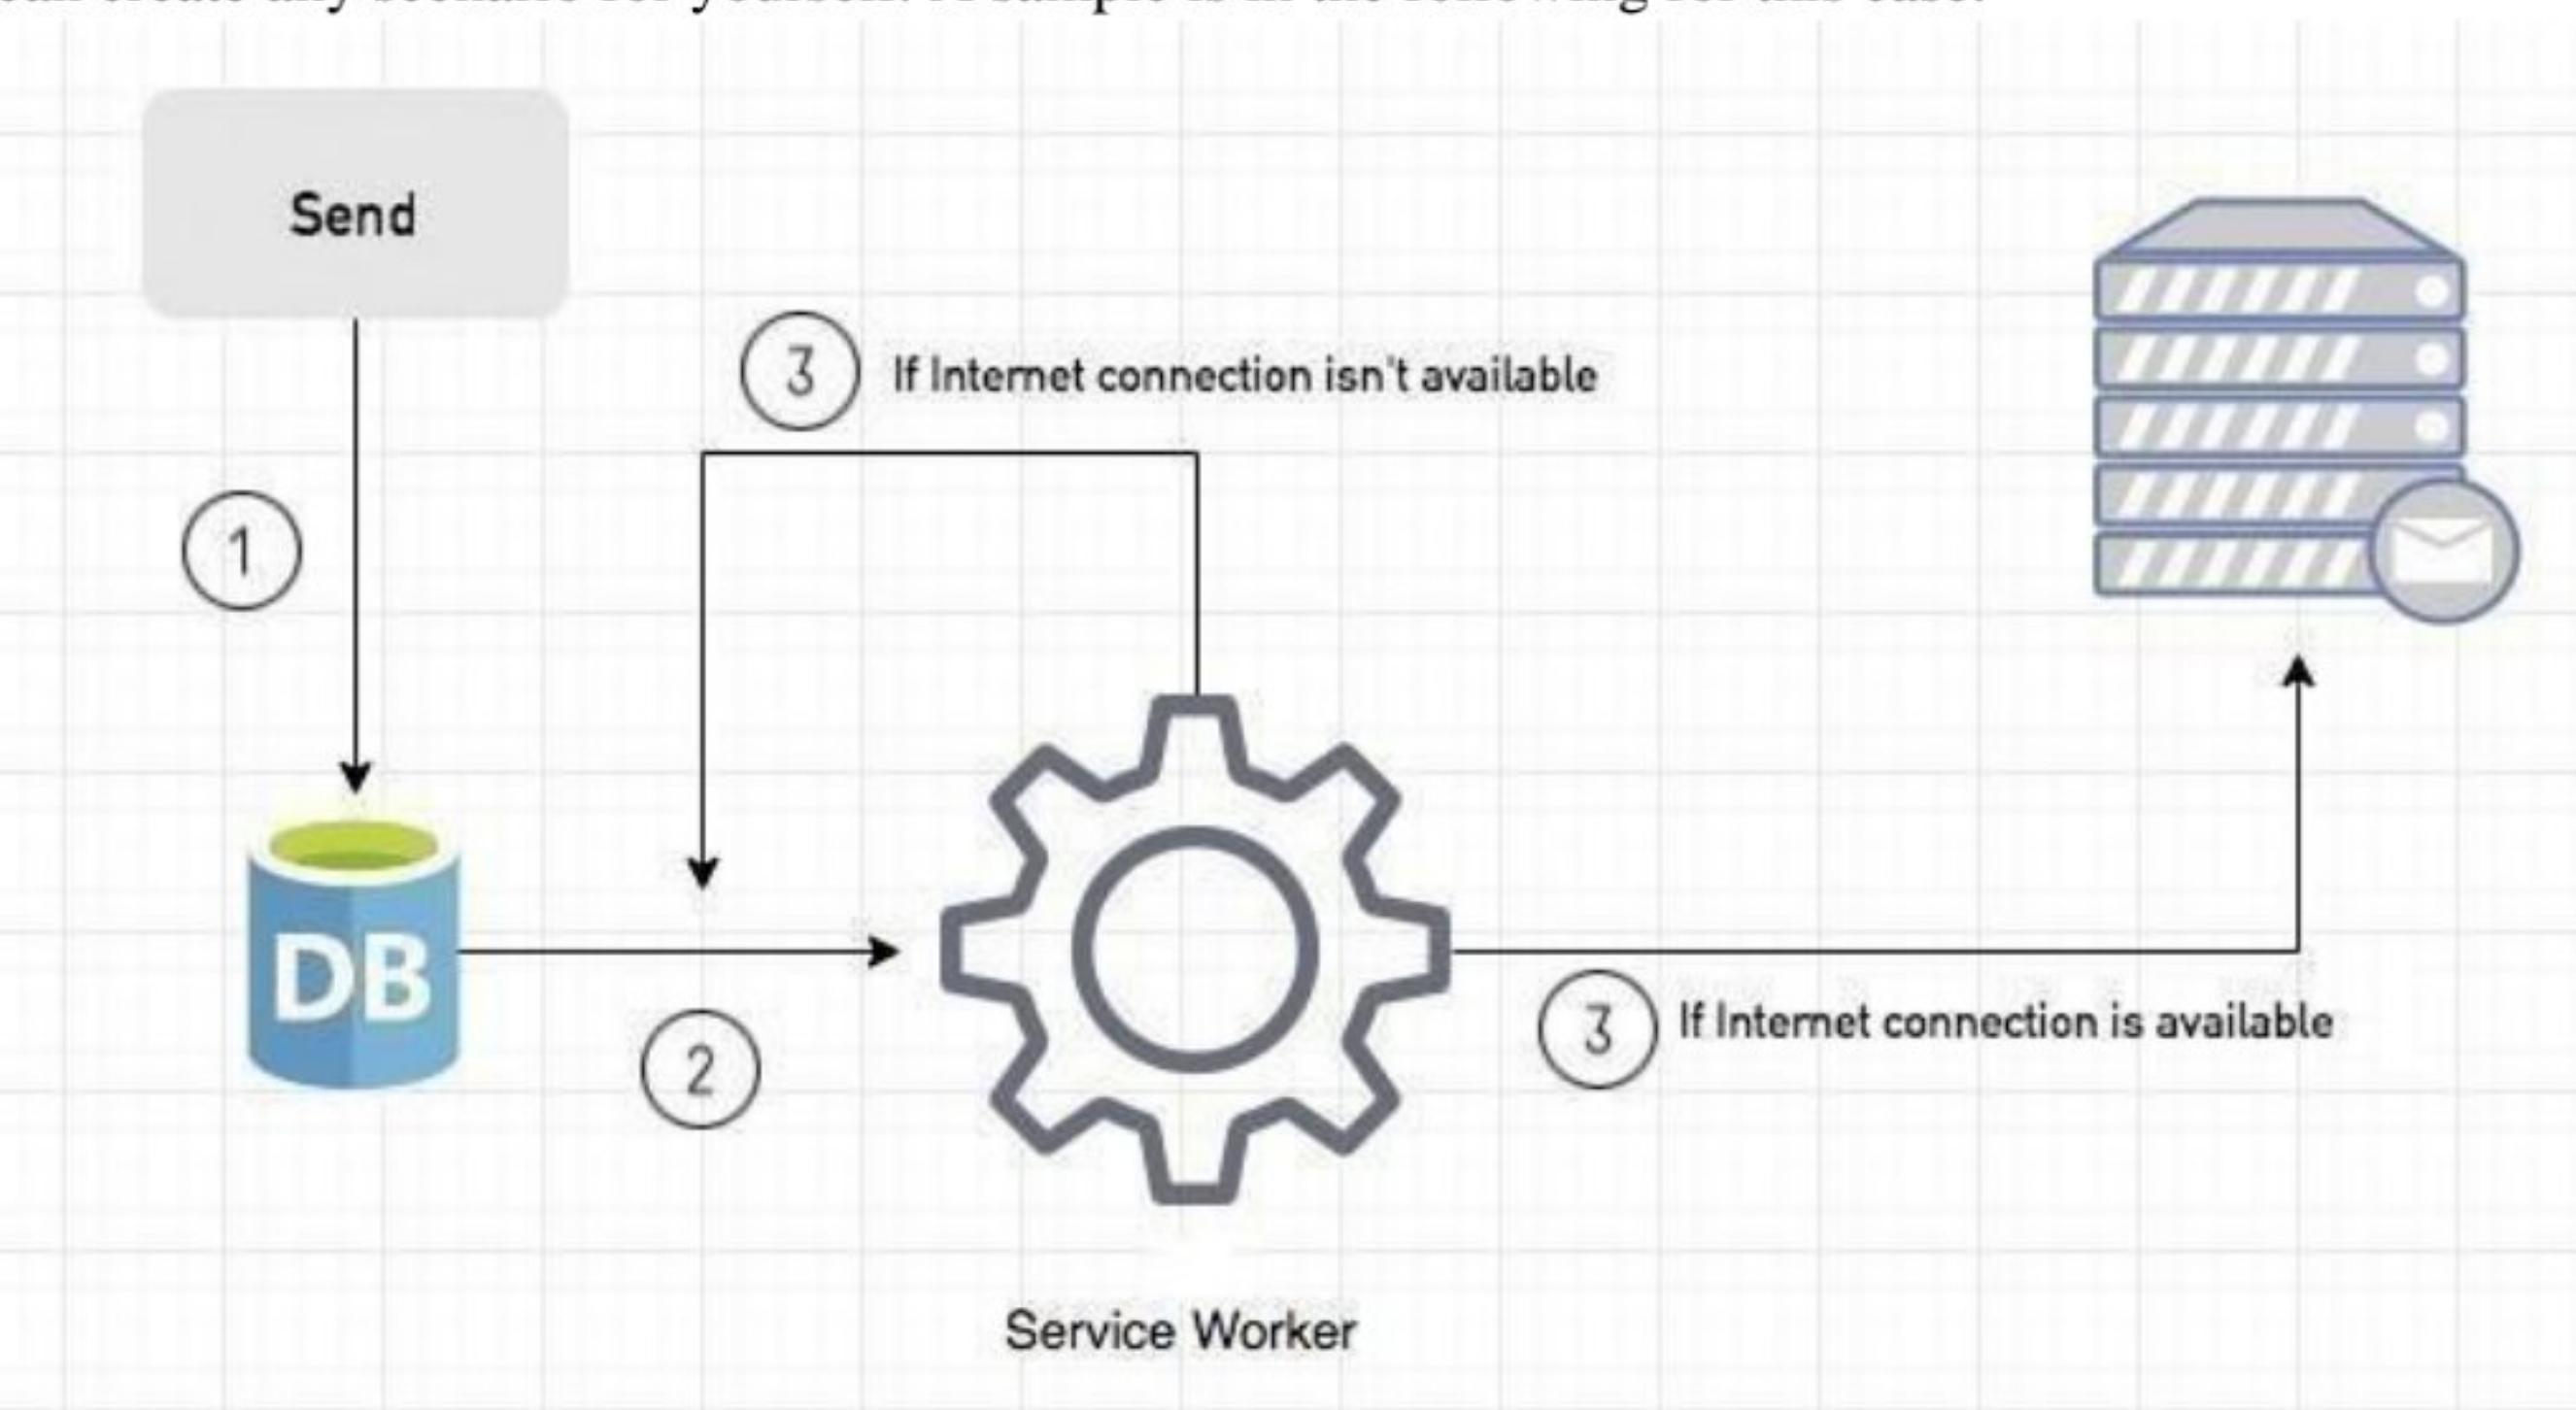

Background Sync is a Web API that is used to delay a process until the Internet connection is stable. We can adapt this definition to the real world; there is an e-mail client application that works on the browser and we want to send an email with this tool. Internet connection is broken while we are writing e-mail content and we didn't realize it. When completing the writing, we click the send button.

Here is a job for the Background Sync.

The following view shows the classical process of sending email to us. If the Internet Connection is broken, we can't send any content to Mail Server.

Here, you can create any scenario for yourself. A sample is in the following for this case.

1. When we click the “send” button, email content will be saved to IndexedDB.
2. Background Sync registration.
3. **If the Internet connection is available**, all email content will be read and sent to Mail Server.
If the Internet connection is unavailable, the service worker waits until the connection is available even though the window is closed. When it is available, email content will be sent to Mail Server.

You can see the working process within the following code block.

Event Listener for Background Sync Registration

```
document.querySelector("button").addEventListener("click", async () => {
  var swRegistration = await navigator.serviceWorker.register("sw.js");
  swRegistration.sync.register("helloSync").then(function () {
    console.log("helloSync success [main.js]");
  });
});
```

Event Listener for sw.js

```

self.addEventListener('sync', event => {
  if (event.tag == 'helloSync') {
    console.log("helloSync [sw.js]");
  }
});

```

Push Event

This is the event that handles push notifications that are received from the server. You can apply any method with received data.

We can check in the following example.

“Notification.requestPermission();” is the necessary line to show notification to the user. If you don’t want to show any notification, you don’t need this line.

In the following code block is in sw.js file. You can handle push notifications with this event. In this example, I kept it simple. We send an object that has “method” and “message” properties. If the method value is “pushMessage”, we open the information notification with the “message” property.

```

self.addEventListener('push', event => {
  if (event && event.data) {
    var data = event.data.json();
    if (data.method === "pushMessage") {
      event.waitUntil(self.registration.showNotification("Test App", {
        body: data.message
      }));
    }
  }
});

```

You can use Application Tab from Chrome Developer Tools for testing push notification **Aim:**
To implement Service worker events like fetch, sync and push for E-commerce PWA.

Theory:

Service Worker

Service Worker is a script that works on browser background without user interaction independently. Also, It resembles a proxy that works on the user side. With this script, you can track network traffic of the page, manage push notifications and develop “offline first” web applications with Cache API.

Things to note about Service Worker:

- A service worker is a programmable network proxy that lets you control how network requests from your page are handled.
- Service workers only run over HTTPS. Because service workers can intercept network requests and modify responses, "man-in-the-middle" attacks could be very bad.

- The service worker becomes idle when not in use and restarts when it's next needed. You cannot rely on a global state persisting between events. If there is information that you need to persist and reuse across restarts, you can use IndexedDB databases.
- Service workers make extensive use of promises, so if you're new to promises, then you should stop reading this and check out Promises, an introduction.

Fetch Event

You can track and manage page network traffic with this event. You can check existing cache, manage “cache first” and “network first” requests and return a response that you want.

Of course, you can use many different methods but you can find in the following example a “cache first” and “network first” approach. In this example, if the request’s and current location’s origin are the same (Static content is requested.), this is called “cacheFirst” but if you request a targeted external URL, this is called “networkFirst”.

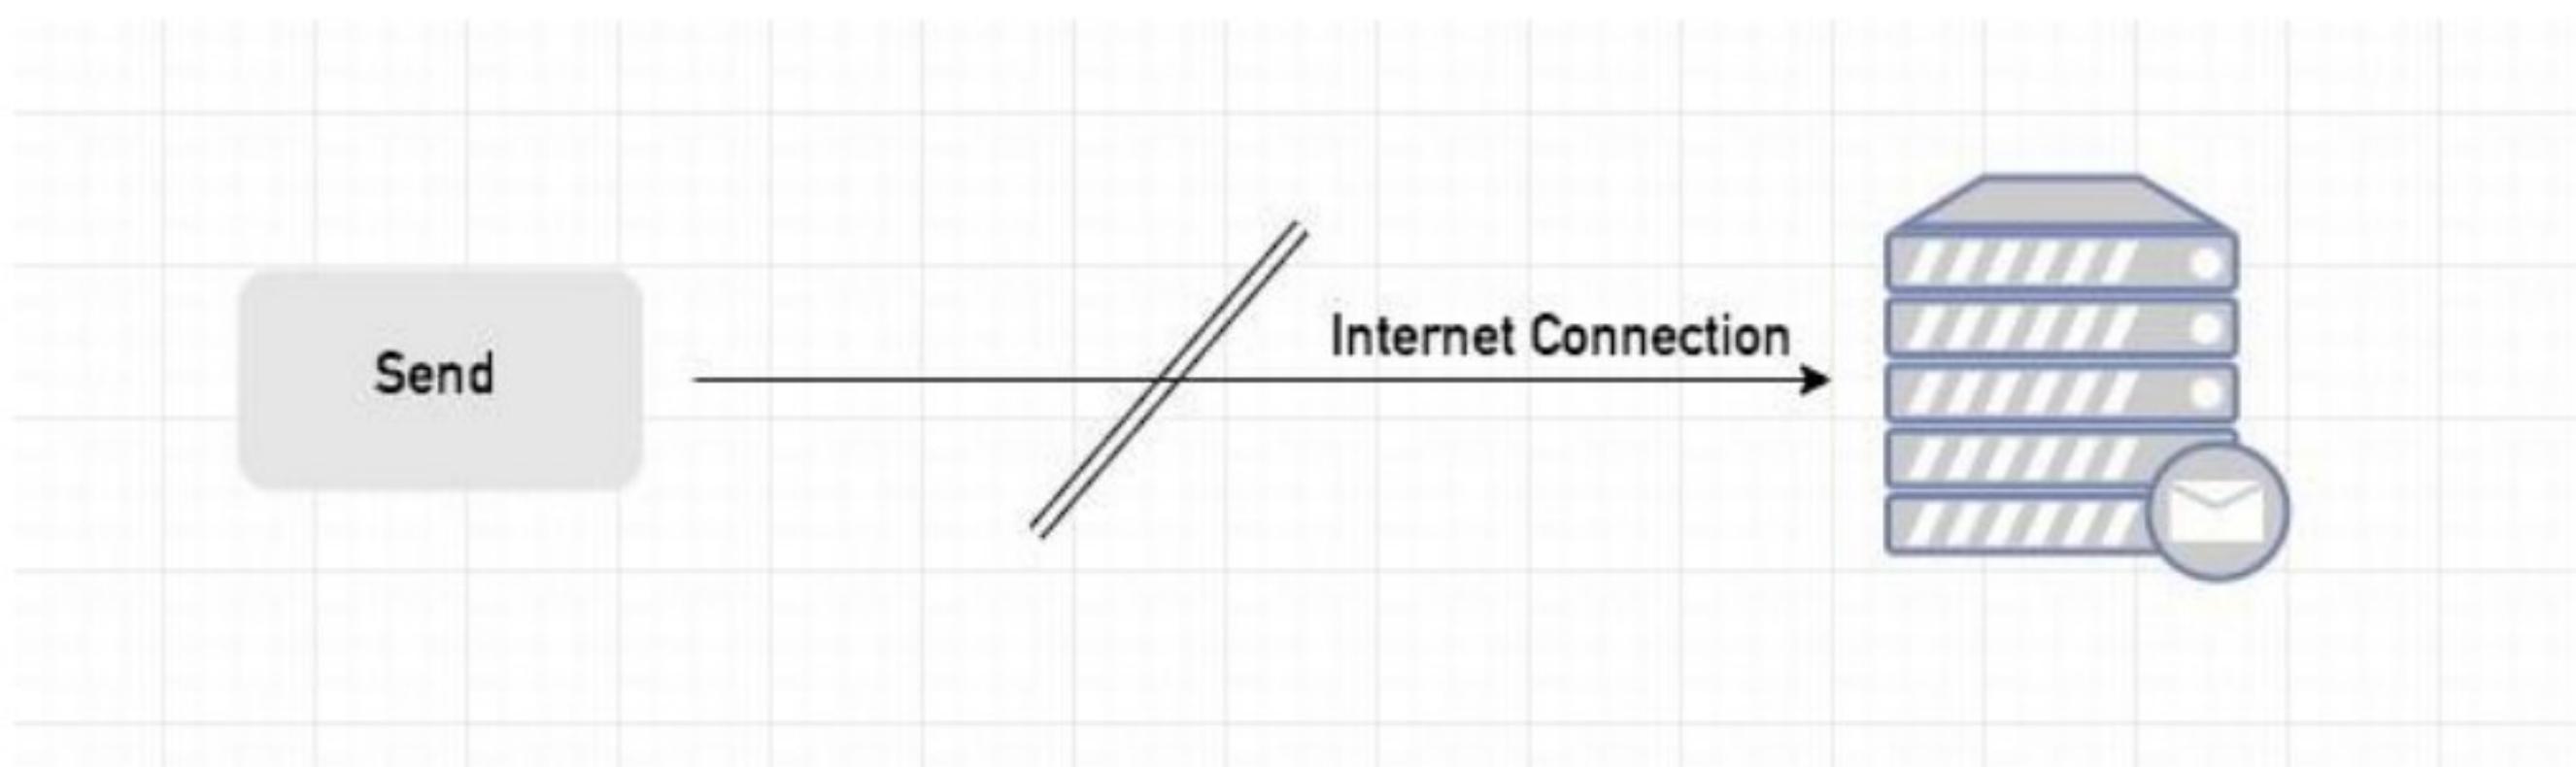

- **CacheFirst** - In this function, if the received request has cached before, the cached response is returned to the page. But if not, a new response requested from the network.
- **NetworkFirst** - In this function, firstly we can try getting an updated response from the network, if this process completed successfully, the new response will be cached and returned. But if this process fails, we check whether the request has been cached before or not. If a cache exists, it is returned to the page, but if not, this is up to you. You can return dummy content or information messages to the page.

Sync Event

Background Sync is a Web API that is used to delay a process until the Internet connection is stable. We can adapt this definition to the real world; there is an e-mail client application that works on the browser and we want to send an email with this tool. Internet connection is broken while we are writing e-mail content and we didn't realize it. When completing the writing, we click the send button.

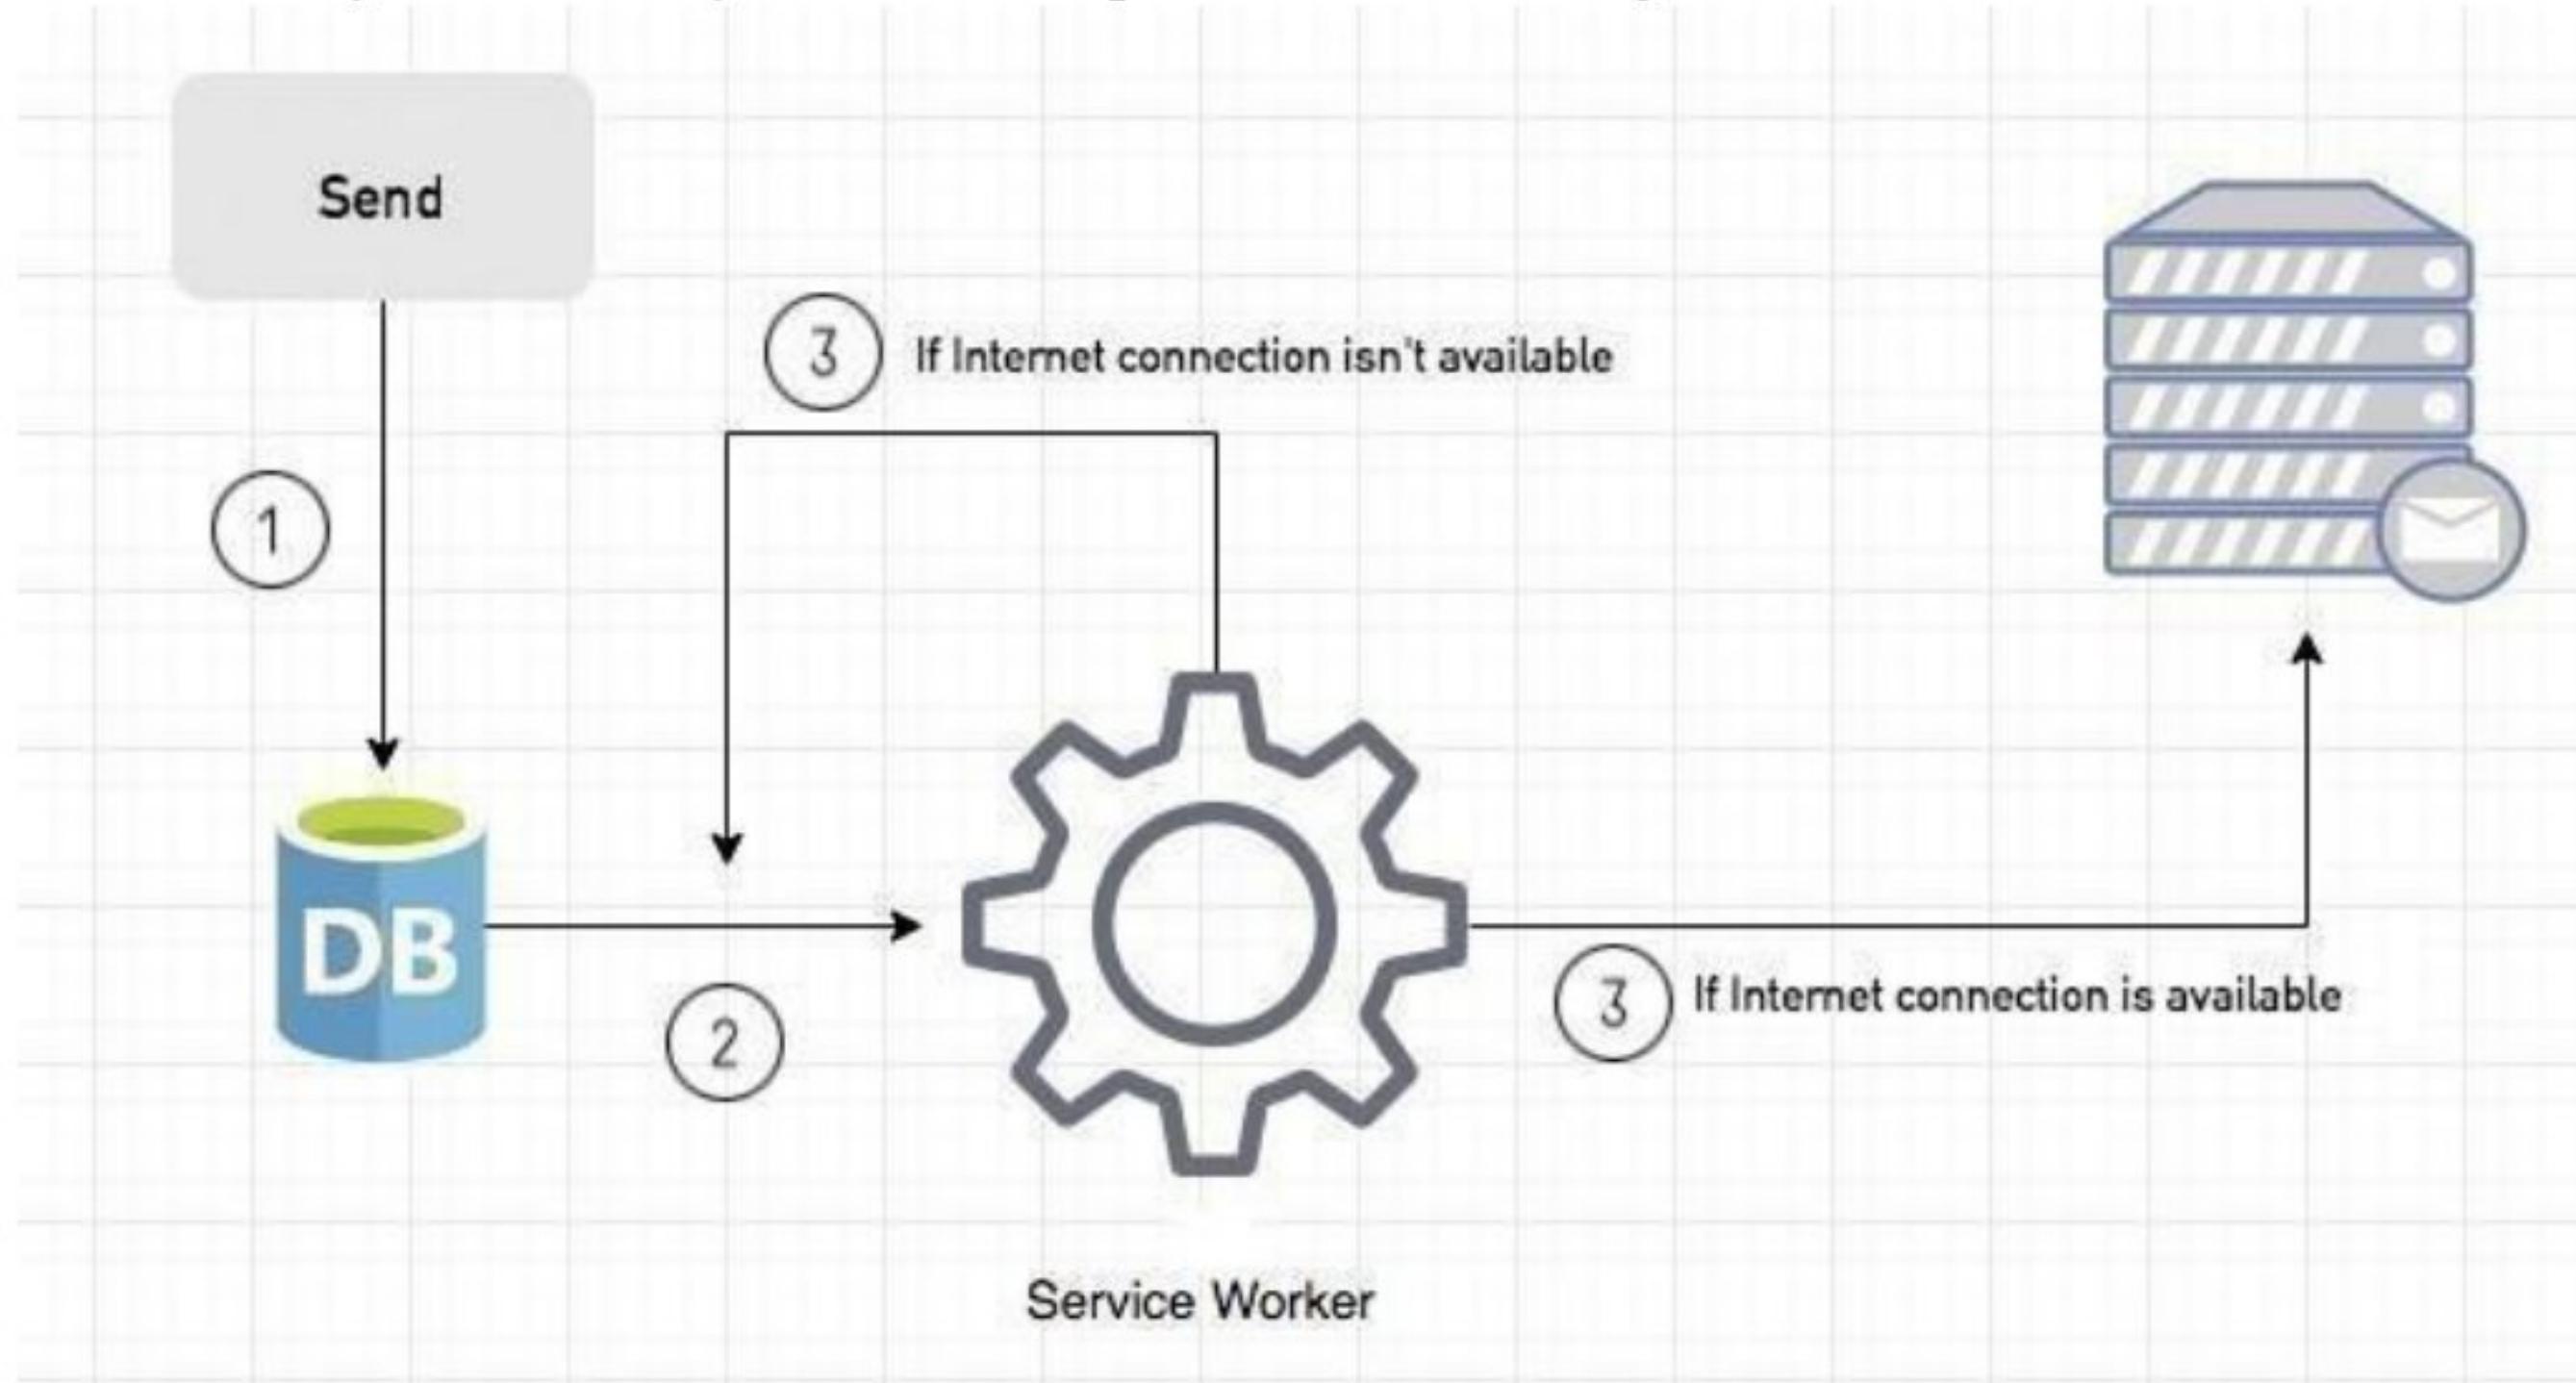

Here is a job for the Background Sync.

The following view shows the classical process of sending email to us. If the Internet Connection is broken, we can't send any content to Mail Server.

```
self.addEventListener("fetch", function (event) {
  const req = event.request;
  const url = new URL(req.url);
```

Here, you can create any scenario for yourself. A sample is in the following for this case.

1. When we click the “send” button, email content will be saved to IndexedDB.
2. Background Sync registration.
3. **If the Internet connection is available**, all email content will be read and sent to Mail Server.

If the Internet connection is unavailable, the service worker waits until the connection is available even though the window is closed. When it is available, email content will be sent to Mail Server.

You can see the working process within the following code block.

Event Listener for Background Sync Registration

```
document.querySelector("button").addEventListener("click", async () => {  
  var swRegistration = await navigator.serviceWorker.register("sw.js");  
  swRegistration.sync.register("helloSync").then(function () {  
    console.log("helloSync success [main.js]");  
  });  
});
```

Event Listener for sw.js

```
self.addEventListener('sync', event => {  
  if (event.tag == 'helloSync') {  
    console.log("helloSync [sw.js]");  
  }  
});
```

Push Event

This is the event that handles push notifications that are received from the server. You can apply any method with received data.

We can check in the following example.

“Notification.requestPermission();” is the necessary line to show notification to the user. If you don’t want to show any notification, you don’t need this line.

In the following code block is in sw.js file. You can handle push notifications with this event. In this example, I kept it simple. We send an object that has “method” and “message” properties. If the method value is “pushMessage”, we open the information notification with the “message” property.

```
self.addEventListener('push', event => {
  if (event && event.data) {
    var data = event.data.json();
    if (data.method === "pushMessage") {
      event.waitUntil(self.registration.showNotification("Test App", {
        body: data.message
      }));
    }
  }
});
```

You can use Application Tab from Chrome Developer Tools for testing push notification.

Code:

In index.html

```
if ('Notification' in window) {  
    Notification.requestPermission().then(function (permission) {  
        if (permission === 'granted') {  
            console.log('Notification permission granted.');//  
        } else {  
            console.warn('Notification permission denied.');//  
        }  
    })  
}
```

// service-worker.js

```
const CACHE_NAME = 'my-eCommerce-app-cache-v1';  
  
const urlsToCache = [  
    '/',  
    'cart.html',  
    'index.html',  
    'product.html',  
    'shop.html',  
    'style.css',  
    'success.html',  
    'service-worker.js',  
    'manifest.json',  
    'offline.html'  
  
    // Add more files to cache as needed  
];
```

```
self.addEventListener('install', function(event) {  
    event.waitUntil(  
        caches.open(CACHE_NAME)  
            .then(function(cache) {  
                console.log('Opened cache');//  
                return cache.addAll(urlsToCache)  
            .catch(function(error) {  
                console.error('Cache.addAll error:', error);  
            })  
    ))  
})
```

```
) );  
}
```

This code sends notification permission to your Device , and click on allow to send push notification service-worker.js

```
) ;  
});  
  
self.addEventListener('activate', function(event) {  
    // Perform activation steps  
    event.waitUntil(  
        caches.keys().then(function(cacheNames) {  
            return Promise.all(  
                cacheNames.map(function(cacheName) {  
                    if (cacheName !== CACHE_NAME) {  
                        return caches.delete(cacheName);  
                    }  
                })  
            );  
        })  
    );  
});  
  
// Fetch event listener  
self.addEventListener("fetch", function (event) {  
    event.respondWith(checkResponse(event.request)).catch(function () {  
        console.log("Fetch from cache successful!");  
        return returnFromCache(event.request);  
    });  
    console.log("Fetch successful!");  
    event.waitUntil(addToCache(event.request));  
});  
  
// Sync event listener  
self.addEventListener('sync', function(event) {  
    if (event.tag === 'syncMessage') {  
        console.log("Sync successful!");  
    }  
});
```

```
// Push event listener

self.addEventListener("push", function (event) {
  if (event && event.data) {
    try {
      var data = event.data.json();
      if (data && data.method === "pushMessage") {
```

```

        console.log("Push notification sent");
        self.registration.showNotification("Ecommerce website", { body:
data.message });
    }

} catch (error) {
    console.error("Error parsing push data:", error);
}

});

self.addEventListener('activate', async () => {
if (Notification.permission !== 'granted') {
    try {
        const permission = await Notification.requestPermission();
        if (permission === 'granted') {
            console.log('Notification permission granted.');
        } else {
            console.warn('Notification permission denied.');
        }
    } catch (error) {
        console.error('Failed to request notification permission:', error);
    }
}
});

var checkResponse = function (request) {
return new Promise(function (fulfill, reject) {
fetch(request)
.then(function (response) {
if (response.status !== 404) {
    fulfill(response);
} else {
    reject(new Error("Response not found")));
}
})
.catch(function (error) {
reject(error);
})
});

```

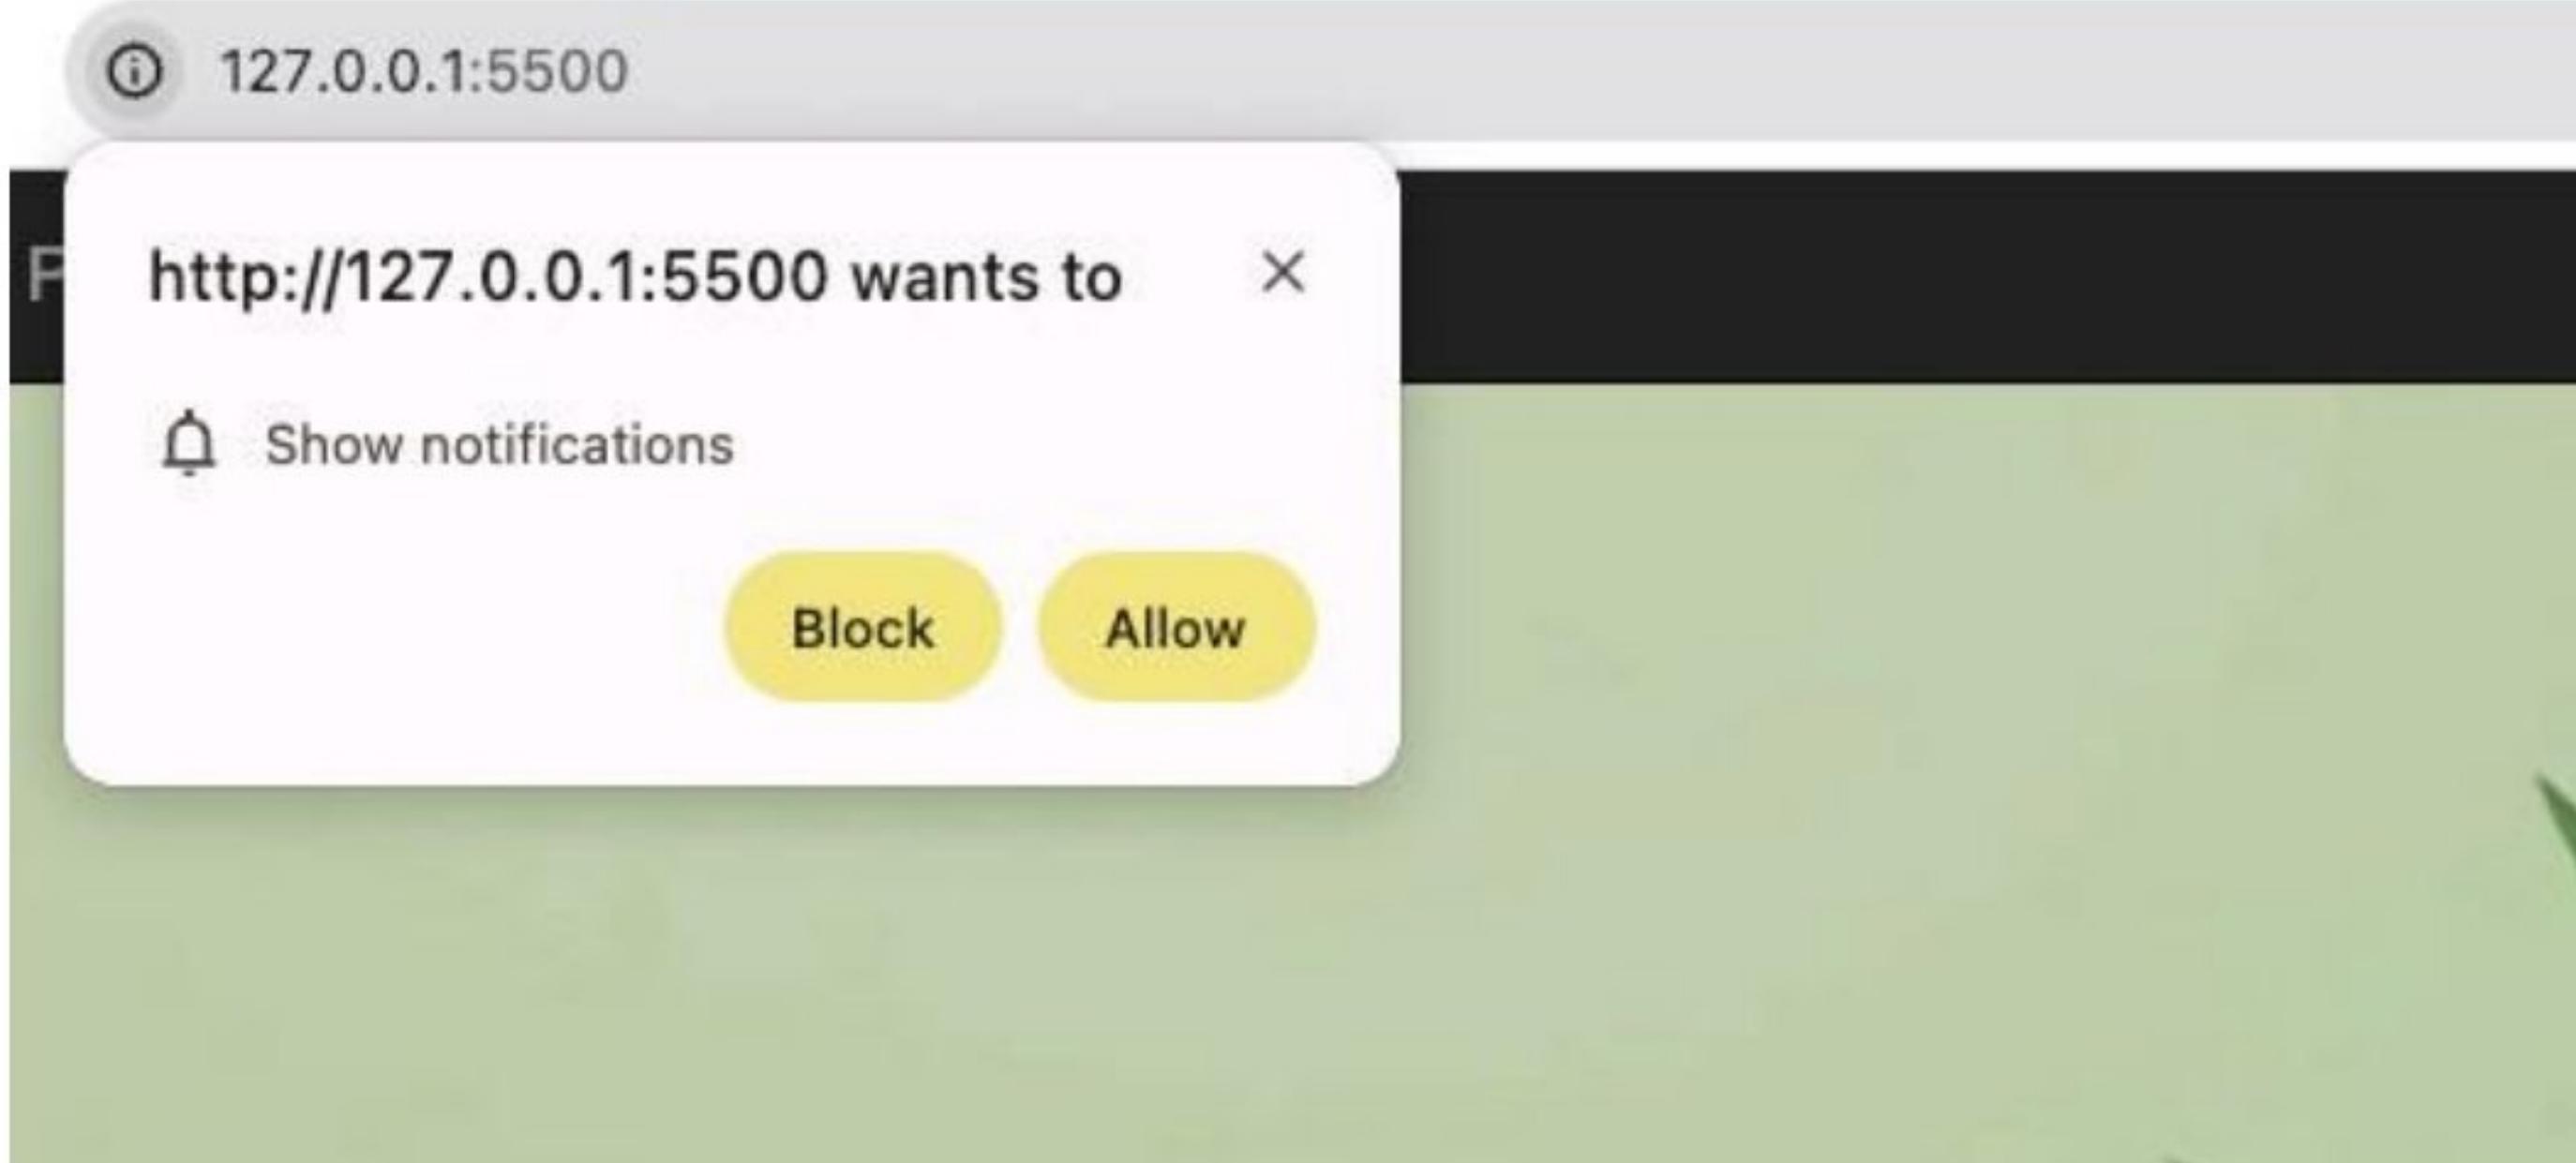

```
});  
});  
};
```

```
var returnFromCache = function (request) {
  return caches.open("offline").then(function (cache) {
    return cache.match(request).then(function (matching) {
      if (!matching || matching.status == 404) {
        return cache.match("offline.html");
      } else {
        return matching;
      }
    });
  });
};

var addToCache = function (request) {
  return caches.open("offline").then(function (cache) {
    return fetch(request).then(function (response) {
      return cache.put(request, response.clone()).then(function () {
        return response;
      });
    });
  });
};
```

Output:

The screenshot shows two instances of a web browser window for a website called "Purity Plants".

Top Window (DevTools Application Tab):

- Left Panel:** Shows the website's homepage with a banner: "All premium plants available here" and "Flat 30% to our new customers". A "Shop Now" button is visible.
- Right Panel (Application Tab):**
 - Service workers:** Shows a service worker named "#244" activated and running.
 - Storage:** Lists Local storage, Session storage, IndexedDB, Web SQL, Cookies, Private state store, Interest group, Shared storage, and Cache storage.
 - Background services:** Lists Back/forward, Background fetch, Background sync, Bounce tracking, Notifications, Payment handling, Periodic background, Speculative loading, and Push messaging.
 - Update Cycle:** Shows three entries: Install, Wait, and Activate.

Bottom Window (DevTools Console Tab):

- Left Panel:** Shows the same website homepage.
- Right Panel (Console Tab):**
 - Output: "Console was cleared", "undefined", and "Push notification sent".
 - Source: "service-worker.js:69".

Conclusion: Hence we implemented methods like fetch, sync, and push on the service worker , and if we push the message, it says “notification received” on the desktop. So the push, sync , and fetch method is implemented successfull.

MAD & PWA Lab Journal

Experiment No.	10
Experiment Title.	To study and implement deployment of Ecommerce PWA to GitHub Pages.

Experiment No 10

Aim:

To study and implement deployment of Ecommerce PWA to GitHub Pages.

Theory:

GitHub Pages

Public web pages are freely hosted and easily published. Public webpages hosted directly from your GitHub repository. Just edit, push, and your changes are live.

GitHub Pages provides the following key features:

1. Blogging with Jekyll
2. Custom URL
3. Automatic Page Generator

Reasons for favoring this over Firebase:

1. Free to use
2. Right out of github
3. Quick to set up

GitHub Pages is used by Lyft, CircleCI, and HubSpot.

GitHub Pages is listed in 775 company stacks and 4401 developer stacks.

Pros

1. Very familiar interface if you are already using GitHub for your projects.
2. Easy to set up. Just push your static website to the gh-pages branch and your website is ready.
3. Supports Jekyll out of the box.
4. Supports custom domains. Just add a file called CNAME to the root of your site, add an A record in the site's DNS configuration, and you are done.

Cons

1. The code of your website will be public, unless you pay for a private repository.
2. Currently, there is no support for HTTPS for custom domains. It's probably coming soon though.
3. Although Jekyll is supported, plug-in support is rather spotty.

Firebase

The Realtime App Platform. Firebase is a cloud service designed to power real-time, collaborative applications. Simply add the Firebase library to your application to gain access to a shared data structure; any changes you make to that data are automatically synchronized with the Firebase cloud and with other clients within milliseconds.

Some of the features offered by Firebase are:

1. Add the Firebase library to your app and get access to a shared data structure. Any changes made to that data are automatically synchronized with the Firebase cloud and with other clients within milliseconds.
2. Firebase apps can be written entirely with client-side code, update in real-time out-of-the-box, interoperate well with existing services, scale automatically, and provide strong data security.
3. Data Accessibility- Data is stored as JSON in Firebase. Every piece of data has its own URL which can be used in Firebase's client libraries and as a REST endpoint. These URLs can also be entered into a browser to view the data and watch it update in real-time.

Reasons for favoring over GitHub Pages:

1. Realtime backend made easy
2. Fast and responsive

Instacart, 9GAG, and Twitch are some of the popular companies that use Firebase. Firebase has a broader approval, being mentioned in 1215 company stacks & 4651 developer stacks

Pros

1. Hosted by Google. Enough said.
2. Authentication, Cloud Messaging, and a whole lot of other handy services will be available to you.
3. A real-time database will be available to you, which can store 1 GB of data.
4. You'll also have access to a blob store, which can store another 1 GB of data.

5. Support for HTTPS. A free certificate will be provisioned for your custom domain within 24 hours.

Cons

1. Only 10 GB of data transfer is allowed per month. But this is not really a big problem, if you use a CDN or AMP.
2. Command-line interface only.
3. No in-built support for any static site generator.

Link for GitHub: https://varunkhubani.github.io/PWA_APP/
GitHub ScreenShots

Step1: Make your GitHub Repository public and push your PWA into the repository

The screenshot shows a GitHub repository named 'PWA_APP' owned by 'VarunKhubani'. The 'Code' tab is selected. The repository has 1 branch ('master') and 0 tags. The file list shows 12 files: 'images', 'product-images', '.DS_Store', 'cart.html', 'homepage.png', 'index.html', 'login.html', 'manifest.json', 'offline.html', 'product.html', 'service-worker.js', 'setting.html', and 'signup.html'. All files were committed 20 minutes ago by 'Varun Khubani'. The repository has 0 stars, 1 watching, and 0 forks. It has 1 commit and 1 deployment to 'github-pages' 16 minutes ago. The languages used are HTML (86.3%) and JavaScript (11.8%).

Step 2: Go to settings -> pages and choose your root directory and save it

The screenshot shows the GitHub Pages settings for the repository "VarunKhubani / PWA_APP". The left sidebar has a "General" tab selected, showing sections for Access, Collaborators, Moderation options, Code and automation (with "Pages" highlighted), Security, Integrations, and GitHub Apps. The main content area is titled "GitHub Pages" and displays the message "Your site is live at https://varunkhubani.github.io/PWA_APP/". It also shows the last deployment was 18 minutes ago by VarunKhubani. Below this, there's a "Build and deployment" section with "Source" set to "Deploy from a branch" (set to "master"), and a "Branch" section indicating the master branch is being used. There's a "Custom domain" section for configuring domains other than the default. A note at the bottom says "Learn how to add a Jekyll theme to your site".

Step 3: Now go to your Code and you will see a small circle near your recent commit(Mine is finished deploying so i am getting a tick-mark sign)

The screenshot shows a GitHub notification for "Varun Khubani" stating "Completed the completed PWA project" with a green checkmark icon next to it. Below this, there's another notification for "images" with the same message "Completed the completed PWA project".

On clicking Logs of all the deployment is shown for convenience

Name: Khushi Jeswani
Division: D15A
Roll No:26
Batch: B

Experiment No 11

Aim : To use google Lighthouse PWA Analysis Tool to test the PWA functioning.

Theory :

Reference :

<https://www.semrush.com/blog/google-lighthouse/>

Google Lighthouse :

Google Lighthouse is a tool that lets you audit your web application based on a number of parameters including (but not limited to) performance, based on a number of metrics, mobile compatibility, Progressive Web App (PWA) implementations, etc. All you have to do is run it on a page or pass it a URL, sit back for a couple of minutes and get a very elaborate report, not much short of one that a professional auditor would have compiled in about a week.

The best part is that you have to set up almost nothing to get started. Let's begin by looking at some of the top features and audit criteria used by Lighthouse.

Key Features and Audit Metrics

Google Lighthouse has the option of running the Audit for Desktop as well as mobile version of your page(s). The top metrics that will be measured in the Audit are:

- 1. Performance:** This score is an aggregation of how the page fared in aspects such as (but not limited to) loading speed, time taken for loading for basic frame(s), displaying meaningful content to the user, etc. To a layman, this score is indicative of how decently the

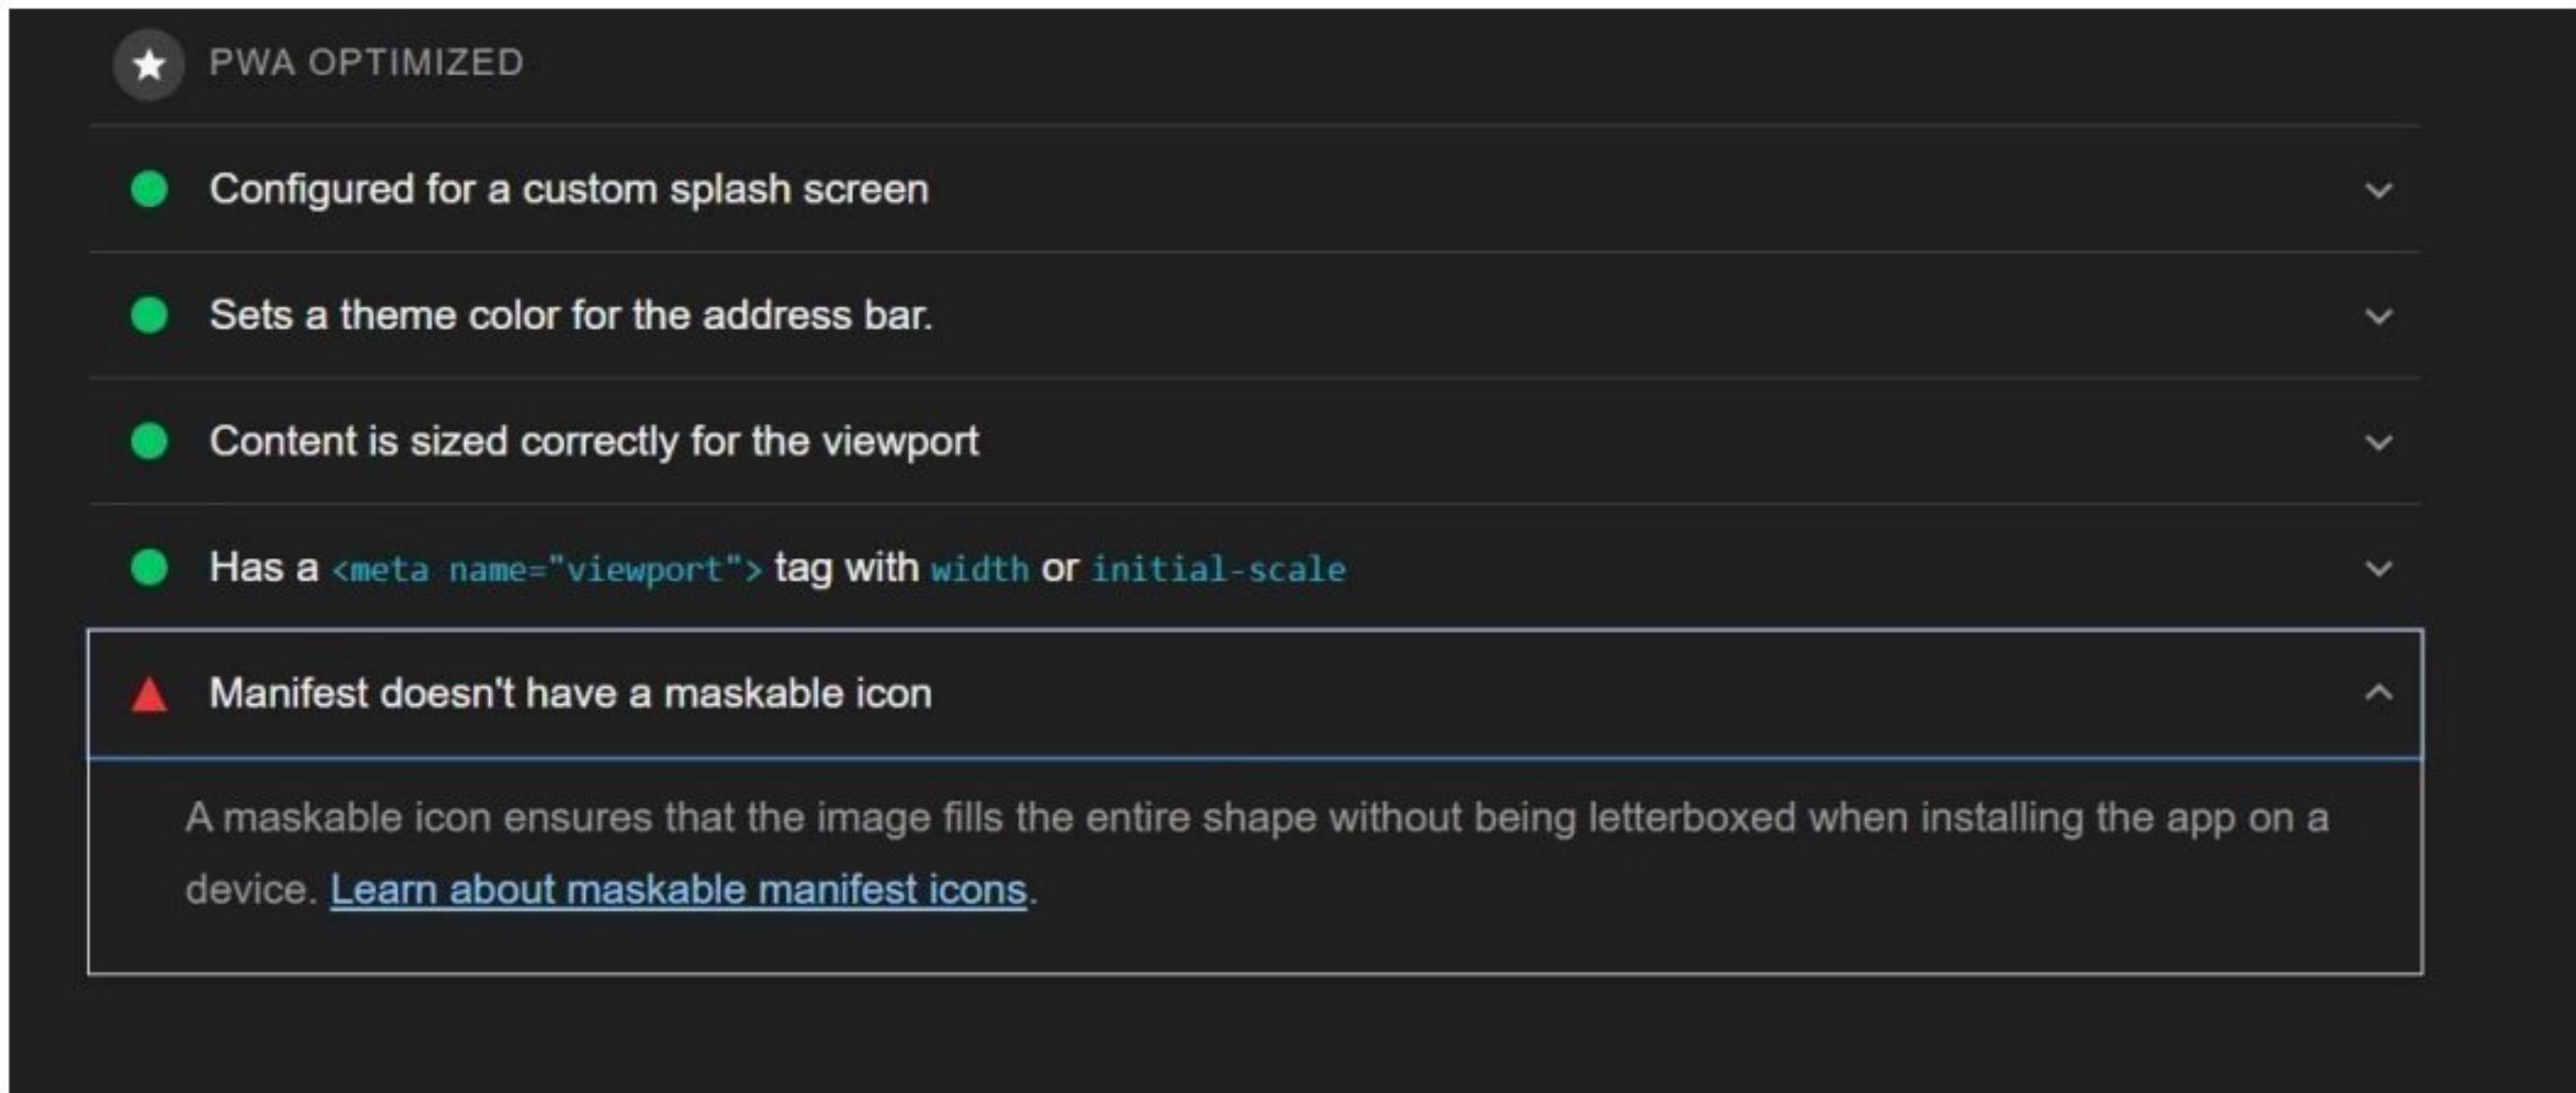

site performs, with a score of 100 meaning that you figure in the 98th percentile, 50 meaning that you figure in the 75th percentile and so on.

2. **PWA Score (Mobile):** Thanks to the rise of Service Workers, app manifests, etc., a lot of modern web applications are moving towards the PWA paradigm, where the objective is to make the application behave as close as possible to native mobile applications. Scoring points are based on the Baseline PWA checklist laid down by Google which includes Service Worker implementation(s), viewport handling, offline functionality, performance in script-disabled environments, etc.
3. **Accessibility:** As you might have guessed, this metric is a measure of how accessible your website is, across a plethora of accessibility features that can be implemented in your page (such as the ‘aria-’ attributes like aria-required, audio captions, button names, etc.). Unlike the other metrics though, Accessibility metrics score on a pass/fail basis i.e. if all possible elements of the page are not screen-reader friendly (HTML5 introduced features that would make pages easy to interpret for screen readers used by visually challenged people like tag names, tags such as <section>, <article>, etc.), you get a 0 on that score. The aggregate of these scores is your Accessibility metric score.
4. **Best Practices:** As any developer would know, there are a number of practices that have been deemed ‘best’ based on empirical data. This metric is an aggregation of many such points, including but not limited to:
Use of HTTPS
Avoiding the use of deprecated code elements like tags, directives, libraries, etc. Password input with paste-into disabled

Geo-Location and cookie usage alerts on load, etc.

Output:

Before

We encountered an issue here , it says “Manifest does not have a maskable icon”

Changes made to the code:

```
{
  "name": "PWA Tutorial",
  "short_name": "PWA",
  "start_url": "index.html",
  "display": "standalone",
  "background_color": "#5900b3",
  "theme_color": "black",
  "scope": ".",
  "description": "This is a PWA tutorial.",
  "icons": [
    {
      "src": "images/Plant 192 X 192.png",
      "sizes": "192x192",
      "type": "image/png",
      "purpose": "any maskable"
    },
    {
      "src": "images/plant 512 X 512.png",
      "sizes": "512x512",
      "type": "image/png",
      "purpose": "any maskable"
    }
  ]
}
```

```
]  
}
```

After:

The screenshot shows the Google Lighthouse PWA analysis results for the URL https://varunkhubani.github.io/PWA_APP/. The overall score is 96. The analysis is categorized into three main sections: **INSTALLABLE**, **PWA OPTIMIZED**, and **ADDITIONAL ITEMS TO MANUALLY CHECK**.

- INSTALLABLE:** Score 96. Audit items:
 - Web app manifest and service worker meet the installability requirements
- PWA OPTIMIZED:** Score 96. Audit items:
 - Configured for a custom splash screen
 - Sets a theme color for the address bar.
 - Content is sized correctly for the viewport
 - Has a `<meta name="viewport">` tag with width or initial-scale
 - Manifest has a maskable icon
- ADDITIONAL ITEMS TO MANUALLY CHECK (3):** Score 74. Audit items:
 - Content is sized correctly for the viewport
 - Has a `<meta name="viewport">` tag with width or initial-scale
 - Manifest has a maskable icon

Conclusion: Hence by making some changes to the code , we did google lighthouse analysis and our PWA is Fully Optimized and ready to go

MAD & PWA Lab

Journal

Experiment No.	Assignment-1
Assignment 1 Questions	<p>1. Flutter Overview: Explain the key features and advantages of using Flutter for mobile app development. Discuss how the Flutter framework differs from traditional approaches and why it has gained popularity in the developer community.</p> <p>2. Widget Tree and Composition: Describe the concept of the widget tree in Flutter. Explain how widget composition is used to build complex user interfaces. Provide examples of commonly used widgets and their roles in creating a widget tree.</p> <p>3. State Management in Flutter: Discuss the importance of state management in Flutter applications. Compare and contrast the different state management approaches available in Flutter, such as setState, Provider, and Riverpod. Provide scenarios where each approach is suitable.</p> <p>4. Firebase Integration in Flutter: Explain the process of integrating Firebase with a Flutter application. Discuss the benefits of using Firebase as a backend solution. Highlight the Firebase services commonly used in Flutter development and provide a brief overview of how data synchronization is achieved.</p>

MAD PWA LAB ASSIGNMENT 01

a) Flutter Overview

Flutter is an open source UI software development toolkit created by Google for building natively compiled applications for mobile, web, and desktop from single codebase.

Key features of flutter:

- a) Single codebase : Flutter offers a single codebase that can be used to create applications for multiple platforms
- b) Hot Reload : Developers can see the changes made in the code instantly reflected in the app
- c) High Performance : Flutter uses the Skia graphics engine to render visuals contributing to smooth animation and a responsive render experience
- d) Access to native features : Flutter provides seamless access to native features and APIs allowing developer to integrate device specific functionalities without compromising on performance

(a) widget tree and composition

Widget tree is a hierarchical structure of UI elements represented by widgets, widgets are the building blocks of flutter applications and the widget tree organizes them in a parent-child relationship. Widget column involves combining simple widgets to create more complex UIs.

Commonly used widgets are:

1. Container
2. Stack
3. List view
4. Text
5. Image

(b) State Management in flutter

State management in flutter is crucial to handle changes in the application data and UI. Proper state management ensures that the UI stays in sync with the underlying data and contributes to a scalable and maintainable codebase.

Some of the state management modules include:

1. SetState: Used for small to medium size applications where state is localized and doesn't need to be shared between multiple widgets.

2. Provider : Well suited for medium to large size applications where you need to share state across different parts of the app

3. Riverpod : Suitable for projects where you want to take advantage of advanced features

Q) Firebase integration in flutter

Integration process

Step 1 : Create a firebase project in firebase website

Step 2 : Add firebase dependencies and flutter fire packages to your local machine

Step 3 : Initialise firebase in your flutter app by calling `firebase.initializeApp()` in the main function

Step 4 : Use firebase services based on your requirements like firestore database, authentication, storage etc.

Benefits of firebase :

1. Real time No-scale database
2. Authentication
3. Cloud storage
4. Hosting

MAD & PWA Lab Journal

Experiment No.	Assignment-2
Assignment 2 Questions	<ol style="list-style-type: none"> 1. Define Progressive Web App (PWA) and explain its significance in modern web development. Discuss the key characteristics that differentiate PWAs from traditional mobile apps 2. Define responsive web design and explain its importance in the context of Progressive Web Apps. Compare and contrast responsive, fluid, and adaptive web design approaches. 3. Describe the lifecycle of Service Workers, including registration, installation, and activation phases. 4. Explain the use of IndexedDB in the Service Worker for data storage.
Roll No.	26
Name	Khushi Jeswani
Class	D15A
Subject	MAD & PWA Lab
Lab Outcome	LO4:Understand various PWA frameworks and their requirements LO5: Design and Develop a responsive User Interface by applying PWA Design techniques LO6:Develop and Analyze PWA Features and deploy it over app hosting solutions
Grade:	4

PWA ASSIGNMENT. 02

- (a) Define Progressive Web App (PWA) and explain its significance in Modern web development. Discuss the key characteristics that differentiate PWAs from traditional mobile apps.

→ A progressive web app (PWA) is a type of web application that uses modern web application capabilities to deliver an app-like experience to users. PWAs are built using standard web technologies such as HTML, CSS, and JavaScript, but are designed to provide a more native-like experience for users especially on mobile devices.

Key characteristics of Progressive Web Apps are:

- ① Progressive enhancement - They are built using progressive enhancement principles, meaning they provide a basic experience for all users and then enhance based on capabilities of the user device & browser.
- ② Responsive design - PWAs are designed to feel and behave like native mobile apps. They include multiple features such as animations, gestures, and transitions to provide a more immersive user experience.
- ③ Reliability - PWAs are designed to be reliable, even when users are offline or have slow or unreliable internet connection. They cache content and resources to ensure that the app remains functional.
- ④ Discoverability - PWAs are easily discoverable and shareable as they are built using standard web technologies and accessed via a URL.
- ⑤ Security - PWAs are served over HTTPS to ensure security.

The significance of PWAs in modern web development lies in their ability to bridge the gap between web and native app experiences by combining the reach and accessibility of the web with functionality & engagement of native apps. They allow developers to create fast, reliable and engaging experience that work seamlessly across a wide range of devices and platforms, helping to improve user engagement, retention, and conversion rates. PWAs are easier and more cost effective to develop and maintain compared to native apps, making them an attractive option for businesses and developers looking to reach a broad audience with their applications.

- (ii) Define responsive web design & explain its importance in the context of progressive web apps. Compare & contrast responsive, fluid and adaptive web design approaches.
- Responsive Web Design is a web design approach that ensure a website adapts its layout and content to seamlessly function and display well across various screen sizes, from desktops to smartphones.
- Importance for PWAs:
- Foundation for App-like Experience - PWA emulates proper layout and navigation across devices mimicking the adaptability of native apps.
 - Accessibility - A responsive design makes PWA accessible to wider audience using diverse devices.
 - SEO benefits - Responsive design is a positive ranking factor in search engine algo, boosting the discoverability of PWAs.

① Responsive Web Design vs Fluid vs Adaptive

feature	Responsive	Fluid	Adaptive
① Layout	flexible, adapts to any screen size	continuously adjusts based on relative units	Uses multiple fixed width layout units
② Development effort	Moderate	less effort for basic layout	More efforts to create multiple layout
③ Control	Good control over overall layout	less control over element appearance on extreme size	High control over layout for each device category
④ Scalability	Ideal foundation due to its versatility	can be used but may require adjustment for optimal exp.	less common for PWA due to development + overload

Q3) Describe the lifecycle of service workers, including registration, installation & activation phases.

→ Service workers are crucial components of progressive web apps (PWA) that enable features such as offline support, push notifications and background synchronization. The lifecycle of service worker involves several key phases:

- ① Registration : 1st phase of lifecycle of service worker
involves service worker occurs in the main JS file of app
- Registration is done using the 'navigator.serviceWorker.register()' method, which takes the path to service worker file as a parameter.
- ② Installation : Once service worker registered browser downloads and starts installations process of service worker script.
- During installation, the service worker script is executed, and the 'install' event is fired. Inside 'install' event handler, developer can define what resources should be cached for offline access using techniques like caching strategies or precaching.
- installations process is utilized for setting up the service worker's initial cache and preparing it to take control of web application.
- ③ Activation - After installation phase, activation phase occurs when service worker is ready to take control of the web application.
- During activation, 'activate' event is fired, giving service worker an opportunity to clear up any old caches or perform other tasks necessary for application functionality.
- Service worker remains active until it is explicitly unregistered or updated.

- Q4) Explain the use of indexed DB in the service worker for data storage
- Indexed DB lets you store and retrieve objects that are indexed with a key, any objects supported by the structured clone algorithm can be stored.
- Indexed DB uses low-level API for client-side storage of significant amounts of structured data, including files & blobs.
